"The Play's the Thing": A creative collaboration to investigate lived experiences in an urban community garden

Journal:	<i>Management Learning</i>
Manuscript ID	MLQ-18-0134.R3
Manuscript Type:	Original Article
Keywords:	arts-based inquiry, non-traditional qualitative research, community organisation, wellbeing, community garden
Abstract:	<p>Presenting the backstage story of a non-traditional qualitative research project, I illustrate how a creative approach can stimulate participant dialogue and encourage researcher reflexivity. Working with an award-winning playwright and the staff and volunteers at a community garden, I explored the meanings of connections between people and nature, and how these connections impact on wellbeing, through a collaborative performance ethnography. The aim of the study is to stimulate discourse around the role of community gardens in enacting social and environmental change for wellbeing. This paper is an exploration of how the creative approach we adopted, incorporating arts-based inquiry and performance as method, contributed to every aspect of the research process. Firstly, it facilitated relaxed communications with the members of the community organisation who participated. Their interest was immediately piqued by the idea of being involved in the development of a play, which led to relaxed, playful discussion. Secondly, the creative approach provided new perspectives on the collection and analysis of data. It expanded my thinking, in developing my methodological approach to the research and in working towards a radical reflexivity. I suggest that creative approaches are applicable to many areas of organisational research.</p>

“The Play’s the Thing”:

A creative collaboration to investigate lived experiences in an urban community garden

“Springtime is me favourite time. It’s the light. Way it runs through the estate, racing down the streets, excited as it hits the houses an’ shops. Even the chippy with its dodgy batter looks better at this time of year. That light bounces from tarmac to brick until eventually it hits here, hits the green and that’s when you realise what light really is when it meets a plant. That’s when you realise what “green” really is when it gratefully pulls that shine in. When spring light hits the plants that’s when the Compost Gets Real. It means the year is on. New shoots pushing through, the world waking up. Bits of colour peeking out all tentative like... Trying to come out at the right time. Too eager, then you may not have what it takes to go the distance, used up all that energy, Jack Frost rotting your leaves, your stems. Too late, too late, too lazy then you can’t get your house in order to bloom. Timing, timing is the King, Queen, Princess and Prince of the garden. Don’t worry, they [the plants] they all know. Been doing it for well, a long time, but even they had to learn it, and there’s many that have fallen. Spring is my favourite time.”

Reproduced from a draft of an opening section of a play by Jimmy Osborne

Activities which take place in urban natural environments, such as community gardens, can provide sources of social support with the potential to improve wellbeing (Polley et al., 2017). In order to develop an understanding of the pathways along which these improvements may occur, I collaborated with an award-winning playwright, Jimmy Osborne, on an exploratory study of a community garden in the city of Kingston-Upon-Hull, UK. We

1 “The Play’s the Thing”

2

3 set out to collect stories told about the garden by the people who spend time there and
4 develop from them a performance piece which would resonate with diverse audiences,
5 stimulating discourse on communal gardening and wellbeing.
6
7
8

9
10 We are interested in evoking reactions in our audiences as we continue this inquiry,
11 allowing these reactions to inform further discourse and discovery. In this I draw a
12 comparison with Shakespeare’s Hamlet as he solves the murder of his father. Hamlet plans to
13 observe King Claudius while telling scenes are performed in a play, considering that his
14 reaction may confirm his guilt. He states:
15
16
17
18
19
20

21 *“I’ll have grounds*

22 *More relative than this—the play’s the thing*

23 *Wherein I’ll catch the conscience of the King.”* (Shakespeare, 2017, Act 2, scene 2)
24
25
26
27

28 Like Hamlet, we wish to draw out audience reactions and make them available for
29 interpretation.
30
31
32

33 In this paper, I narrate the backstage story of our collaborative research project. The
34 story illustrates how a creative approach can stimulate participant dialogue and encourage
35 researcher reflexivity. Using dramaturgical principles to describe the study of social life from
36 the perspective of a theatrical performance, Goffman (1959) suggests that backstage is where
37 illusions and impressions are knowingly constructed for a front stage performance. In the
38 backstage region of our data collection process, I found that my research methods continually
39 evolved as I engaged with the research participants and with Jimmy, in constructing the
40 impressions which were to form the basis of a performance.
41
42
43
44
45
46
47
48
49
50

51 I begin the narration by setting the scene with an exploration of literature relevant to
52 community gardening organisations and wellbeing. I then explain our rationale for choosing
53 to approach the study through a collaborative performance ethnography. Next, I provide an
54 overview of the methods we used before presenting some of our initial research findings.

2
3 Finally, I discuss the implications of a creative approach or “play factor” for stimulating
4 participative dialogue and encouraging researcher reflexivity.
5
6
7

8 **Setting the scene**

9
10 Founded by a group of residents, who secured a lease of a piece of state-owned scrap land in
11 an urban residential area for a nominal fee, this community garden has been developed over
12 two decades. Now a registered charity run by a small group of trustees, two paid members of
13 staff, and an informal group of volunteers, it is a site for growing food, a space for recreation,
14 and a wildlife habitat. I first explain why the garden may be defined as a community
15 organisation, then go on to explore how impacts on wellbeing are conceptualised in this
16 context.

22
23
24
25
26

27 **The community garden as a community organisation**

28
29 At the commencement of the study, I conceptualised the garden as a social-ecological
30 system (Ostrom, 2009). Within it, organisational components interact: its people, its physical
31 and organic non-human elements (plants, animals, earth, air), and the governance systems
32 (natural and cultural) which influence its management. Social, economic, and political
33 contexts influence, and are influenced by, each of these components.
34
35
36
37
38
39

40
41 As research progressed, I came to identify the garden more specifically as an example
42 of a bottom-up community organisation (Zoller, 2005). This informal network of volunteers,
43 staff and trustees, working in partnership with other organisations such as schools and local
44 government authorities, is forming a community hub. By organising to empower individuals
45 and build relations; the community impacts wellbeing on a wide scale by enacting social and
46 environmental change. Actions to bring about environmental enhancement by providing
47 wildlife habitat and promoting environmentally responsible behaviour can influence social
48 and environmental determinants of health (Marmot & Bell, 2012).

4

2
3 **Frameworks for understanding the impacts of gardening on wellbeing**

4
5 Frameworks used to describe the process of “green care” may be useful in the pursuit
6
7 of an understanding of the mechanisms by which direct impacts of gardening on wellbeing
8
9 occur. Green care is defined by Cutcliffe and Travale (2016) as using nature in “targeted
10
11 processes that are designed to have a positive effect on the holistic health and wellbeing of an
12
13 individual” (p.138). Although community gardening is not necessarily a targeted process, and
14
15 does not therefore meet criteria for green care, it does involve working with nature and may
16
17 impact wellbeing, even if it does so incidentally.
18
19

20
21 Two frameworks have been published recently, which outline the pathways along
22
23 which wellbeing is influenced through green care. Cutcliffe and Travale (2016) propose that
24
25 its underpinning elements are contact with nature, occupation/work as a therapeutic activity,
26
27 connectedness, and the benefits of exercise. Similarly, Bragg and Atkins (2016) provide an
28
29 overview of green care as the convergence of natural surroundings, meaningful activities, and
30
31 social context.
32
33

34
35 The frameworks differ in their treatment of “connectedness”. Although Bragg and
36
37 Atkins (2016) include “sense of belonging” in a social context, the theory proposed by
38
39 Cutcliffe and Travale includes “connectedness” with non-human components of the
40
41 environment. This proposal is related to the concept of biophilia, put forward by Wilson
42
43 (1984), as a human affinity with life and lifelike processes. This idea of connectedness to
44
45 natural environments is further explored by Cleary et al. (2017), through the application of
46
47 Self Determination Theory (Ryan and Deci, 2000). Cleary et al (2017) suggest that
48
49 connection with nature fosters intrinsic value orientations, as well as fulfilling the basic
50
51 psychological need of relatedness, through non-human relatedness.
52
53

54
55 My aim in this study then, was to understand the ways in which connections between
56
57 people and the natural environment of the garden interact to influence wellbeing. These
58
59 connections may influence individual wellbeing along pathways similar to those described in
60

“The Play’s the Thing”

5

green care frameworks. They may also influence wellbeing on a wider scale, through community actions to promote social and environmental change.

Methodology

I sought to develop an understanding of connections within this community, and their impacts on wellbeing, through discourse regarding the experiences and stories of those who use the garden. I approached the study through a collaborative performance ethnography (Denzin, 2003), working with garden users and the playwright, Jimmy Osborne. The following sections explain my rationale for using an arts-based inquiry incorporating performance. I then go on to discuss the importance of reflexivity and the significance of different ways of knowing in this research.

Arts-based inquiry

The involvement of a playwright was a rather novel step in researching links between wellbeing and the environment, although visual and performing arts are utilised extensively in healthcare settings. For example, they are used to enhance recovery environments (Staricoff et al., 2001) and also play a role in many rehabilitative care plans (Symons et al., 2011). Creative approaches have also been highly effective in organisational research praxis. For example, Bramming et al. (2012) used “snaplogs” (snapshots and logbooks), composed by research participants, to create platforms for focus group discussions.

Nair et al. (2018) argue that in addition to playing a role in research methodology, creative mediums can be valuable in showcasing the products of inquiry and increasing their reach. This was our primary driver for developing a performance piece. We hoped it would increase the reach of this research, beyond traditional means of dissemination, so that it might inspire people from diverse audiences to take part in similar activities, as well as inform health and social care providers and urban planners about the potential for urban nature to promote wellbeing.

“The Play’s the Thing”

6

1
2
3 As we discovered, artists bring unique ways of examining and communicating
4 experience to the research process (McNiff, 2013). Artistic freedom and a lack of fixed
5 methods can facilitate the resistance of norms, which is both a challenge and an opportunity
6 in the context of research. Research has its own norms in the prescriptive forms of theory,
7 data, and method (Ganesh, 2014). Attempts to resist these norms can result in criticism of
8 qualitative researchers as lacking in methodological rigour (Najda-Janoszka & Daba-
9 Buzoianu, 2018). However, with transparency in research design, analytic approach, and
10 theoretical contribution, the richness of inquiry facilitated by artistic processes may be
11 embraced and rendered credible (Ashworth et al., 2019).

Performance as method

12
13
14
15
16
17
18
19
20
21
22
23
24
25
26 We chose to develop a performance because this medium involves a combination of
27 visual and auditory stimuli which can provide depth and context for the language used,
28 “merging the text with the world” (Madison, 2005, p.172) and has the potential to be widely
29 accessible. Further, research-based drama is an approach with a history of influencing health
30 policy (e.g. Nisker, 2012). Having no theatrical training and as a result, little faith in my
31 personal ability to develop a compelling performance piece, I chose to enlist a playwright in
32 the project.

33
34
35
36
37
38
39
40
41
42 As Goffman (1959) demonstrated, dramaturgy offers an effective means of exploring
43 the social, as well as the formally staged, performance. He explained that each of us performs
44 when we enter the presence of others. We know that the others will seek to acquire
45 information about us or apply to us information they already possess, concerning us directly
46 or people or groups with whom they associate us. We may consciously attempt to create an
47 impression which either reinforces or refutes expectations through our words and actions. For
48 this reason, social interactions are highly complex. Although we rely on inference and
49
50
51
52
53
54
55
56
57
58
59
60

“The Play’s the Thing”

7

1
2
3 interpretation in our dealings with both the physical and the social world, in the social world
4
5 our interpretations are open to attempts by others to lead or mislead us in our inferences.
6
7

8 I also recognise the importance of being reflexive about my own research and writing
9
10 process. The choices I make in researching the garden and in writing about it are influenced
11
12 by my own conscious or unconscious attempts to create an impression. Resulting research
13
14 outputs can have consequences, due to their potential to influence actions. Most importantly,
15
16 these research outputs are not all the product of my own work, but contain the personal
17
18 narratives of research participants, albeit anonymised.
19
20

21 Madison (2003) advocates discharging the responsibility this engenders through an
22
23 attempt to inhabit the “creative, complex, slippery terrain” (p.471) between cynicism and
24
25 zeal, in a performance of possibilities. The cynicism to which Madison refers is the
26
27 assumption that the attainment of self-critical performance is impossible, while the zeal is the
28
29 (mistaken) belief of a researcher that they are representing the other exactly as the other
30
31 would wish. To inhabit this terrain, we must engage in discourse, opening up new
32
33 perspectives for our audiences. In doing so, we must critically examine our own purposes and
34
35 assumptions. In doing so, we must critically examine our own purposes and
36
37 assumptions.
38
39

40 **Reflexivity**

41 I aim to meet my responsibilities as a researcher by striving to achieve “radical
42
43 reflexivity” (Cunliffe, 2003). In this I aim to be transparent about the ways in which the
44
45 knowledge I present is built up, and from who and where it may originate (Cunliffe, 2018).
46
47 Cunliffe (2003) further requires that the fallibility of the researcher is surfaced, through the
48
49 provision of explicit indications of the ways in which the values of the researcher(s) may
50
51 have influenced a piece of research and the communication of that research to others. This is
52
53 no attempt to justify an objective stance on an external reality, but rather to recognise the
54
55 normative and performative nature of the creation of research outputs (Ganesh, 2014).
56
57
58
59
60

“The Play’s the Thing”

8

1
2
3 Ganesh (2014) recommends that qualitative researchers move away from prescriptive
4 formulas of theory, data, and method which may be more applicable to positivist and post-
5 positivist work. Attempts to comply with these formulas in qualitative inquiry may result in
6 the production of dualist accounts alternating between the confessional and the realist. He
7 suggests that this may be avoided by using vignettes of experience, which present, “frank
8 accounts that always and already situate knowledge as a product of the sometimes-
9 incompetent researcher” (Ganesh, 2014: 455). By presenting vignettes as creative works, we
10 invite the audience to view them in their context.
11
12
13
14
15
16
17
18
19
20

21 In this paper, I make use of vignettes and extracts from the draft play script, along
22 with quotes from interviews, conversations and written contributions to the research. I invite
23 you, as the reader, to view these extracts in their context. I endeavour to follow the
24 framework of crystallisation, which Ellingson (2009) defines as combining “multiple genres
25 of representation into a coherent text or series of related texts, building a rich and openly
26 partial account of a phenomenon that problematizes its own construction, highlights
27 researchers’ vulnerabilities and positionality, makes claims about socially constructed
28 meanings, and reveals the indeterminacy of knowledge claims even as it makes them.”
29
30
31
32
33
34
35
36
37
38
39

40 Ellingson (2009: 4)

41
42 I include script and interview extracts and creative vignettes within the written format
43 of this paper with the aim of presenting a rich, openly partial account of my research. Further,
44 this paper is one of several planned outputs of the research, along with the play currently
45 under development and my PhD thesis. Together, these and any other future outputs will
46 combine multiple genres of representation.
47
48
49
50
51
52
53

54 **Ways of knowing**

55 Mounier (1952) describes the “person” as “a fount of experience, springing into the
56 world, it expresses itself by an incessant creation of situations, life-patterns and institutions”
57
58
59
60

1 “The Play’s the Thing”

2
3 (p. vi). In this study, I tried to elucidate the meanings of activities carried out in the garden,
4
5 and their impacts on wellbeing, through the expressions of the founts of experience of the
6
7 staff and volunteers at the garden. Mounier (1952) states that the central affirmation of
8
9 personalism is the “existence of free and creative persons” (p. iii). By engaging with
10
11 creativity, we attempt to tap the fount of experience which springs from free and creative
12
13 persons.
14
15

16
17 In tapping this fount of experience, we are exploring phronesis, translated by Cassell
18
19 et al. (2009) as “practical wisdom”. This type of knowledge entails acting from what one
20
21 knows to “make things happen” (Zackariasson, 2006, p.421). Phronesis encompasses tacit,
22
23 informal knowledge, not just explicit knowledge. It is often tacit knowledge which permits us
24
25 to act within our individual and shared circumstances. Informal ways of sense-making are
26
27 often taken for granted, but by critiquing them we may undermine dominating structures and
28
29 practices, opening up new ways of thinking and acting (Cunliffe, 2002).
30
31

32
33 This tacit knowledge was what I wanted to uncover and critically examine. What
34
35 knowing-in-action is possessed by the staff and volunteers in a long-standing community
36
37 garden, about the way in which the organisation works and how positive impacts on
38
39 wellbeing are realised? Could explication of this knowledge help others to achieve similar
40
41 results in different settings and circumstances? Could it provide guidelines for those who
42
43 might seek to support this particular garden, or gardens like it? An artistic approach to a
44
45 collaborative ethnography allowed me to work with participants to surface this tacit
46
47 knowledge, by providing a platform for open, creative discussion.
48
49

50
51 My background is rooted in health and environmental sciences. I have an
52
53 undergraduate degree in veterinary medicine and worked as a veterinary practitioner for
54
55 fifteen years before returning to academia. Prior to the commencement of this research, I was
56
57 already convinced that community gardening could have significant benefits to wellbeing,
58
59
60

“The Play’s the Thing”

10

1
2
3 having witnessed the impacts of bonds between people and nonhuman organisms in my years
4
5 spent working with pets and their owners. I also wished to provide evidence of these benefits,
6
7 believing that such evidence might help to protect urban green spaces, which my
8
9 understanding of environmental science and ecology leads me to consider to be important
10
11 wildlife habitats.
12
13

14
15 By undertaking this study in a collaborative manner, I hoped to bring together diverse
16
17 viewpoints, reducing the risk of my projecting my own prior thoughts and experiences onto
18
19 others. The results of our research still present a rather one-sided view, with everyone
20
21 involved having only positive things to say about their time spent in the garden. This is
22
23 hardly surprising, as everyone involved had chosen to be there. However, our results are not
24
25 intended to represent either the natural reality of the garden or the cultural reality of its staff
26
27 and volunteers. Rather, they are presented as an invitation to join an ongoing dialogue about
28
29 the complex relationships which form between people and other living organisms.
30
31

32
33 Performance is an especially appropriate medium for presenting these results. As
34
35 Shotter & Tsoukas (2014: 387) suggest, “when we take a *practical* attitude to the world, we
36
37 seek to go out towards a concrete situation in all its richness and particularities” (emphasis in
38
39 original). In an evocative physical space such as a garden we may experience a situation
40
41 through all of our senses: sight, sound, touch, scent and even taste. A performance can help to
42
43 communicate this rich, sensory knowledge about a ‘concrete’ situation (Shotter & Tsoukas,
44
45 2014), combining as it does a range of sensory stimuli (Madison, 2005).
46
47
48
49

50 **Methods**

51
52 I originally planned to utilise workshops in the collection of data, based on Soft
53
54 Systems Methodology (SSM; Checkland, 1993). However, I met with staff and volunteers at
55
56 the garden during the planning stage of the study, and we decided together that workshops
57
58 were not the best method of inquiry for three reasons. Firstly, although the best location in
59
60

1 “The Play’s the Thing”

2
3 which to carry out the inquiry was undoubtedly in the natural surroundings of the garden
4
5 itself, there was limited space there for people to gather. Secondly, volunteers came to the
6
7 garden at various times, on different days. As it was unusual for everyone to be together in
8
9 the same location at the same time, people would have to change their routines to attend
10
11 group workshops. Thirdly, conversations flowed more easily when I worked alongside staff
12
13 and volunteers in the garden, than when we sat down with the expressed intention of talking.
14
15

16
17 Instead, we opted for a combination of ethnographic participant observation and one-
18
19 to-one interviews. We were able to retain one valuable feature of SSM, however. Checkland
20
21 (1993) suggests that “rich pictures”, composed of free-form diagrams, drawings and text, are
22
23 better media than linear prose for expressing a complexity of multiple interacting
24
25 relationships. We included a variety of media in the data we collected, including pictures
26
27 drawn in our sketchbook (figures 1 &2). In the following sections I detail our data collection
28
29 process, my entry into the field and some of the ways in which our methods evolved during
30
31 the research process.
32
33

34 35 **Data collection**

36
37 Having received ethical approval from the Faculty of Business, Law and Politics
38
39 Research Ethics Committee at University of Hull, I visited the garden, sometimes alone and
40
41 sometimes in company with Jimmy, on an approximately weekly basis during the summer
42
43 and autumn of 2017. Written information about the study was kept on display at the garden
44
45 throughout this period. In it, Jimmy’s role in the study was made clear, including his intention
46
47 to develop a fictionalised performance piece through the research.
48
49

50
51 Jimmy and I worked in the garden and I recorded observations of actions and
52
53 interactions as fieldnotes. I also conducted interviews or recorded conversations with three
54
55 volunteers, two members of staff and a trustee of the garden. Jimmy and I discussed our
56
57 observations and impressions in person, after each visit to the garden in which he
58
59
60

“The Play’s the Thing”

12

1
2
3 participated. Acting as an interpretive ethnographer, I also shared my field notes, interview
4 transcripts and analysis and autoethnographic observations with Jimmy. He used my notes, in
5
6 combination with his own first-hand impressions of the garden, to begin development of a
7
8 text which will be performed. In turn, my own impressions were influenced by his comments
9
10 during our discussions.
11
12
13

14 **Entering the field: Researcher reflections**

15
16 At the inception of this project, I requested information from the City Council
17
18 regarding communal open spaces, and an environment officer agreed to meet with me. Based
19
20 on the information she provided, I identified the garden as a potential site for the study. It is
21
22 well-established, open to all, and hosts a variety of activities, including food-growing and the
23
24 enhancement of wildlife habitats. These features render it a likely source of insight into the
25
26 impacts of nature-based activities on individuals and their communities.
27
28
29

30
31 My first entrance into the garden was an emotionally ‘striking’ moment (Corlett,
32
33 2013; Cunliffe, 2002), which I illustrate below in a narrative vignette of the occasion.
34

35
36 *“So, what is the Rainbow Garden, exactly?” I asked the council officer who was*
37
38 *advising me on communally accessible open spaces in the City of Hull.*

39
40 *“It’s just a nice garden. You should go and take a look: it’s not far from the*
41
42 *university.” she replied.*
43

44
45 *We’d talked about several spaces during our meeting, but the Rainbow Garden*
46
47 *sounded intriguing. Situated in a “deprived” area, the simple fact that it was still thriving*
48
49 *after 20 years made it worthy of further investigation. I drove there when I left the council*
50
51 *offices.*
52

53
54 *I’d dressed unusually smartly that morning, in preparation for my meeting. As I got*
55
56 *out of my car in a North Hull housing estate, I realised that I stood out in these surroundings*
57
58 *like a middle-class sore thumb. I’m not naturally very confident about novel social situations,*
59
60

1 “The Play’s the Thing”

2
3 *so this realisation made me want to jump back into the car and head for the familiar*
4 *environment of the university. Instead, I took a deep breath and I forced myself to walk*
5 *towards the iron gates which marked the entrance to the garden.*
6
7

8
9
10 *The area seemed deserted, but as I peered through the gate, I spotted a young woman*
11 *wearing work boots and a sweatshirt, walking through the garden. She looked up at the*
12 *sound of my shiny office shoes clacking on the pavement, and favoured me with an open,*
13 *welcoming grin. Greeting me without any fuss, the young woman listened while I explained*
14 *that I was a student at the university, planning a research project on the organisation of*
15 *communal open spaces which aim to promote wellbeing. She told me that I should really*
16 *speak to the garden’s founder, who wasn’t there that morning, but offered to show me*
17 *around.*
18
19
20
21
22
23
24
25
26
27

28
29 *I felt profound relief, on meeting this friendly, down-to-earth character. Still slightly*
30 *ill-at-ease in my unfamiliar “office meeting” attire, I did wonder what she thought of me. Did*
31 *she think I fancied myself an expert in gardening (I’m not) or wellbeing (I’m not)? Did she*
32 *expect me to be worried about getting earth on my posh coat (I wasn’t - at least, not much)?*
33 *If she did think those things, she kept them to herself, while I marvelled at this beautiful little*
34 *haven of growing things in the middle of a housing estate. From the centre of the garden, the*
35 *surrounding houses can be seen, achingly familiar to me, because their design was exactly*
36 *like that of the house I grew up in. I’d been told that the garden had been built on a bit of*
37 *waste ground. I remembered patches of waste ground in the area where I grew up and*
38 *couldn’t imagine anyone taking the time and care to turn them into a wonderland. Yet, it had*
39 *happened here. Why? How? And could I help to nurture it, and make it happen elsewhere?*
40
41
42
43
44
45
46
47
48
49
50
51
52
53

54 I returned to the garden when the founder was present and found her eager to take part
55 in a study which might demonstrate the value of the garden to its staff and volunteers, and to
56 wider communities. Staff at the garden described all the people who spent time there, unpaid,
57
58
59
60

1 “The Play’s the Thing”

14

2
3 as, “volunteers”, regardless of whether they had been referred to the garden by health or
4
5 social care practitioners or had come of their own volition. This prevents people from being
6
7 labelled as either “healthy” or “unwell”, but rather means that all visitors who work in the
8
9 garden have the potential to be treated equally. I follow this convention in using the term,
10
11 “volunteers” to describe all those who are not paid staff but who work in the garden.
12
13

14
15 As the vignette demonstrates, I was influenced in my choice of the study setting by
16
17 the feeling of familiarity with the environment. This “deprived” area looked very much like
18
19 the place where I grew up. Once I returned in my normal, everyday clothes, I felt profoundly
20
21 at ease in the garden, and with the staff and volunteers there. I then contacted Jimmy, a friend
22
23 and local playwright whom I knew to have an interest in gardening and sustainability. I found
24
25 him similarly interested in becoming involved in the project.
26
27

28 **The Evolution of Methods in the Research Process**

29
30 Our methods of data collection continued to evolve throughout the research, in
31
32 response to the apparent needs or wishes of the research participants. Fundamental to our
33
34 ethical approach then, was the recognition that as forms of participation evolved, it could
35
36 become necessary to renegotiate the terms of informed consent. We endeavoured to keep
37
38 channels of communication as freely open as possible. Staff at the garden helped to explain
39
40 the project to the volunteers and were instrumental in directing Jimmy and I to those who
41
42 were willing to talk to us. They also steered us away from those who were less keen on being
43
44 directly involved in the project. This helped to safeguard against the possibility of our
45
46 presence detracting from any wellbeing benefits derived by volunteers from their gardening
47
48 activities. Participants were of course made aware that they had the option to withdraw
49
50 completely from the research process, at any stage.
51
52

53
54
55 The process of data collection involved us in a social performance; we took part in
56
57 ordinary, day-to-day interactions, based upon a cultural script (Madison, 2005). Jimmy and I
58
59
60

1 “The Play’s the Thing”

2
3 became a part of the established community of the garden as we assumed our roles within it.
4
5 By working together with that community on a project of which everyone feels they have
6
7 ownership, Jimmy and I took on the roles of colleagues in a shared project, rather than of
8
9 incoming “experts”. While our position remained outside the core community of the
10
11 everyday life of the garden, the shared development of a performance piece created a parallel
12
13
14
15 community.

16
17 It became evident, within this community, that some of the gardeners were
18
19 uncomfortable with a formal interview approach. One member of staff was particularly
20
21 reluctant to be interviewed, although she readily gave consent for informal conversations to
22
23 be recorded. She didn’t like the idea of being in the spotlight and mentioned that she also
24
25 disliked having her photograph taken. In common with several other participants, she seemed
26
27 keen to discuss the garden, but did not want to talk directly about herself. The concept of
28
29 developing a play was useful here, as we were able to decentre individual experiences and
30
31 perhaps previously imposed health diagnoses and labels, in favour of a more abstract
32
33 discourse on the nature of garden and its associated community. Rather than pressing
34
35 participants to take part in interviews, I adapted my approach to make greater use of
36
37 ethnographic methods of observation.
38
39
40
41

42
43 Later in the study, we also decided to provide gardeners with the opportunity to
44
45 contribute their thoughts and stories in written form. We provided a sketchbook to be kept in
46
47 the garden, and I wrote a note inside which read, “Please feel free to write stories, messages,
48
49 or draw pictures on any of these pages. You can add your name, so I know who you are, or
50
51 don’t, if you don’t wish to.” This decision resulted from a conversation I had with Jimmy on
52
53 our drive home from the garden one day. Jimmy had walked with Carol (a member of staff)
54
55 to the local shop at lunchtime and they had passed a man, who had nodded to them. Carol
56
57 explained that he was someone who occasionally volunteered in the garden, then she began
58
59
60

“The Play’s the Thing”

16

1
2
3 talking about volunteers who had come and gone in the past. This was a significant juncture
4
5 in the development of our research, and I present this story as I heard it on the car journey
6
7 from Jimmy:
8
9

10 *One volunteer who used to come to the garden was a man who enjoyed betting on*
11 *horse racing. He often had short blue pens in his pocket, which bookies’ (bookmakers’) shops*
12 *provide for their patrons to fill out betting slips with. This volunteer was not given to chatting*
13 *over a cup of tea, but rather came to work in the garden at quiet times. Carol said that*
14 *sometimes the only sign that he had been in the garden was a freshly turned patch of earth,*
15 *with one or two bookies’ pens left on it. It seemed that the pens dropped out of the volunteer’s*
16 *pocket as he worked.*
17
18
19
20
21
22
23
24
25

26 *Carol’s story struck me particularly because I had vivid memories of those same pens*
27 *scattered around my childhood home. My dad, who died shortly before I began this project,*
28 *was an avid gambler.*
29
30
31
32

33 *The story struck Jimmy for a different reason. He was intrigued by the possibilities it*
34 *entailed. What if the volunteer left those pens deliberately, wishing to signal to the other*
35 *volunteers and staff that he’d been present? What if he didn’t? What were the reasons for his*
36 *apparent avoidance of direct contact with the others? Jimmy wanted to explore these*
37 *possibilities in his drama, while I was moved to consider how I might alter my research*
38 *design so that different modes of communication were made available to our research*
39 *participants.*
40
41
42
43
44
45
46
47
48

49 I decided to alter my research design by providing the sketchbook in which
50 participants were invited to write comments or draw pictures. To stimulate discourse around
51 life in the garden, amongst contributors to the sketchbook, I attached a poster to its front
52 cover (Figure 1). The poster displayed themes I had identified by carrying out some initial
53
54
55
56
57
58
59
60

“The Play’s the Thing”

17

open coding (Birks and Mills, 2015) of three interview transcripts and three sets of field notes relating to conversations with individual members of staff and volunteers.

By identifying important groups of words across the interview transcripts and conversation notes, I had developed eight themes which staff and volunteers talked about in relation to the ways in which working in the garden impacted their wellbeing. I created a poster displaying the three most frequently identified of these themes (*talking, sense of purpose and sense of achievement*) as text and images and the other five themes (*learning, relaxing, feeling safe, being outside and eating fresh*) as text only.

[Insert Figure 1]

Eight volunteers and staff in the garden made entries in the sketchbook. Some of these may have been the same people who had given interviews or had conversations recorded, as entries were able to be made anonymously. We were, in essence, creating a “rich picture”, but asynchronously rather than in a face-to-face workshop environment. The sketchbook formed a collaboratively developed collection of text and images, describing lived experiences of the community garden (Figure 2).

[Insert Figure 2]

The decision to introduce the sketchbook as an opportunity for research participants to communicate indirectly and non-verbally was prompted by the story told to me by Jimmy on our journey home from the garden. As such, it is an example of one of the ways in which our creative collaboration shaped the research process. I was struck by Jimmy’s retelling of the story and by his response to it, moving me to change my way of acting through “an embodied rather than purely cognitive understanding” (Cunliffe, 2002: 42).

Initial research findings

The most unexpected outcomes of the study arose not from the initial thematic analysis, which closely echoed the mechanisms of green care outlined by Cutcliffe and Travale (2016) and Bragg and Atkins (2016), but in the narratives related by staff and

“The Play’s the Thing”

18

1
2
3 volunteers at the garden, regarding the circumstances leading to their participation in
4
5 gardening and their experiences and interactions there. These narratives allow us to explore
6
7 the ways in which relationships between people, activities and the environment play out in
8
9 the garden, influenced by and influencing culture. Presented here are some fragments of
10
11 narratives constructed through the study. They are divided into three categories.
12
13

14
15 Firstly, “purpose of the garden” contains stories which relate to the needs the garden
16
17 fulfils for the people who use it. Secondly, “people-people connections” are the social
18
19 interactions which took place in the garden, relative to the wellbeing of those involved.
20
21 Finally, “people-nature connections” refers to the relationships formed between people and
22
23 nonhuman elements of the garden.
24
25

Purpose of the garden

26
27
28 Some of the participants were partly drawn to the garden because it resonated with
29
30 childhood experiences of being in natural surroundings. Barbara described her memories of
31
32 playing in wild spaces within the city:
33
34

35 *“I was brought up in a house where there was no gardens, so our play area*
36
37 *was the drain side...I suppose it was a health hazard really, but to us it*
38
39 *wasn't. But there was loads of frogs. Also, our parents took us to the local*
40
41 *park...to see all the little – I think it was sticklebacks, they called them.”*
42
43

44
45 Barbara remembers being drawn to natural spaces and wild creatures as a child,
46
47 although she had no garden of her own at that time. She acknowledges that to adults
48
49 her choice of play area might have seemed unsafe but points out that for her and for
50
51 other children it was a place of fascination.
52

53
54 Angela, a volunteer at the garden, told me that her grandparents had had an orchard,
55
56 where she spent half of her summer holidays from school, as a child. They grew apples,
57
58 pears, plums, and all kinds of soft fruit, from which they used to make jam. Her grandmother
59
60

1 “The Play’s the Thing”

2
3 also let her pick the fallen apples, which weren’t sent off in big trucks with the other fruit for
4
5 selling. She and some other children would check that the fruit was still good, put it in paper
6
7 bags, and pack it into a pram. They earned their pocket money by wheeling the pram along
8
9 the road and selling the fruit, door-to-door.
10
11

12 People also referred to negative circumstances in their lives outside of the garden,
13
14 which had led them to come there. The garden was referred to as a “haven”, a “natural, safe”
15
16 and “calming, peaceful” environment with a “nice atmosphere”. Two interviewees and one
17
18 anonymous commenter who wrote in the sketchbook said that their symptoms of depression
19
20 or anxiety were eased when they spent time there. One volunteer, who did not contribute to
21
22 interviews or recorded conversations, and who had begun coming to the garden following a
23
24 brain injury, wrote a comment in the sketchbook about how he is able to lose himself in the
25
26 garden, and enjoy what he is doing “without having to concentrate on lots of different
27
28 things”.
29
30
31
32

33 Negative circumstances impacting on the lives of members of the community may
34
35 have their sources in larger societal and political issues. Carol, a member of staff at the
36
37 garden, told me a story about a past volunteer who had been having a difficult time. She said
38
39 it was clear that the volunteer wasn’t getting enough to eat, so she made sure he took
40
41 vegetables home, and shared her lunch with him when he was at the garden. She told me that
42
43 the garden was a place where people helped each other, although she clearly felt upset that
44
45 such help was necessary, because people had been failed by the welfare and social care
46
47 systems which should have protected them.
48
49

50
51 Others seemed to discover the garden almost by chance, with no particular urge to
52
53 either return to a childhood experience or to escape from a negative aspect of their lives. For
54
55 example, some volunteers came to the garden initially through work, and then continued to
56
57 attend. One comment in the sketchbook read,
58
59
60

“The Play’s the Thing”

20

1
2
3 *“The garden helped me to bring some of the Travellers’ children, who were*
4 *close to being excluded. This was a great place for them to come and be*
5 *themselves. I also enjoy coming to see the gang and get on their nerves*
6 *with all my talking.” Anonymous*
7
8
9
10
11

12 **People-people connections**

14 Laughter appeared to connect people in the garden above all else. An anonymous
15 carer, who brings an adult client with learning difficulties to the garden, wrote in the
16 sketchbook that he had, *“done some painting and planting with my client, who is very funny”*.
17 Barbara told a story, during her interview, about something which happened in the garden to
18 make her and others who were with her laugh. She went on to say,
19
20

21 *“All them little things what stay in there are what I think does make you*
22 *mentally well. We’re not just living on memories. We’ve also got the added*
23 *pleasure of something different happening each day. We’re like,*
24 *discovering all the time.”*
25
26
27
28
29
30
31
32
33

34
35 A separate comment in the sketchbook also described how the setting of the garden
36 fostered unique connections between people,
37
38

39 *“I love to see how people change and open up, laugh and joke and how*
40 *satisfying it is when people make connections that they might never make in*
41 *other situations.”*
42
43
44
45

46 Jimmy made sure to include some down-to-earth humour in his script, as
47 demonstrated by the following excerpt from a draft of a scene in which two characters argue
48 over whose turn it is to empty the composting toilet.
49
50
51

52
53 *MARCH The rota works*

54
55 *TOBY Then why is the toilet full?*

56
57 *MARCH Your turn last to swap the bins on it.*
58
59
60

1 “The Play’s the Thing”

2
3 *TOBY Was not.*

4
5 *MARCH Check the rota.*

6
7 *TOBY What you saying?*

8
9 *MARCH Check the rota, Toby. That’s what I’m saying.*

10
11 *TOBY You saying I don’t pull my weight?*

12
13 *MARCH The R-O-T-A.*

14
15 *TOBY I’ve emptied that toilet many, many times, I won’t have anyone say I haven’t.*

16
17 *MARCH Whose turn was it last then?*

18
19 *TOBY Not mine.*

20
21 *MARCH You sure?*

22
23 *TOBY Yeah.*

24
25 *Pause.*

26
27 *TOBY sticks his head in the shed, comes out.*

28
29 *Drains his tea and put the mug down.*

30
31 *TOBY Somebody changed rota?*

32
33
34
35
36
37
38 In this excerpt, the fictional character, Toby, is righteously indignant about having to
39 undertake an unfairly high proportion of an unpleasant chore. He appears to be wrong in his
40 perception, according to the rota in the shed suggests otherwise. Jimmy was keen to include
41 humour in his script, both to entertain an audience and to reflect the particularly down-to-
42 earth brand of humour we encountered in the garden. This underscores the character of the
43 space as being far from a romanticised utopia.
44
45
46
47
48
49

50
51 The practical, unromantic character of interactions in the garden was something
52 Jimmy and I both noted. Rather than a utopian space, this garden could be described as a
53 heterotopia, in that it represents something other than the dominant social norms, where
54 alterity and difference may be embraced. Steyaert (2010) notes that Derek Jarman’s garden
55
56
57
58
59
60

1 “The Play’s the Thing”

22

2
3 was such a space, providing a setting where dominant norms may be resisted and new forms
4
5 of, in this case sexual, identity generated and practiced. In our garden, forms of identity
6
7 imposed by socio-economic class distinctions and medical diagnoses are resisted. Jacques
8
9 (2002: 29) states, *“If we retain the cynicism of the dystopia, but remove the weight of despair,*
10
11 *we create the context from which heterotopia emerges”*. Perhaps laughter helps us to retain
12
13 cynicism while casting off the weight of despair.
14
15

16
17 In combination with laughter, the presence of children in the garden was talked about
18
19 often. Family days are run during the school holidays, when children come with their families
20
21 to take part in creative and in gardening activities. The garden is sometimes used for school
22
23 visits too. As one comment in the sketchbook read, the garden is,
24
25

26 *“a place to be creative, make friends, have fun and breathe. A chance for*
27
28 *the children to run free in a natural, safe environment.” Anonymous*
29

30 Staff and volunteers gained pleasure from watching children playing in the garden,
31
32 benefitting from its characteristics as a haven and a place of escape. The presence of children
33
34 in the garden was generally welcomed by volunteers and staff, as an added source of
35
36 enjoyment and entertainment, although the garden was also referred to at times as a desirably
37
38 quiet and peaceful place. Children were generally not present during school hours, so the
39
40 garden was peaceful at some times and joyful at others. There is also a quiet area of the
41
42 garden, not open to children. It is primarily kept quiet as it is very close to private residences,
43
44 garden, not open to children. It is primarily kept quiet as it is very close to private residences,
45
46 but it may provide a refuge for those who need it.
47
48
49

50 **People-nature connections**

51
52 The dynamic nature of life in the garden, the growth of plants and the changing of the
53
54 seasons influenced the experienced of its users. Angela commented that working in the
55
56 garden was different from doing housework, because, *“you can do housework and sometimes*
57
58 *it don’t look no different”*. She points out the difference between working in a non-living
59
60

“The Play’s the Thing”

23

environment, where the effects of your actions may be eroded over time, and working *with* a living environment, where your agency combines with nonhuman agency to influence ongoing processes, such as the growth of vegetation from seeds you have planted.

People discussed the satisfaction they gained from watching seeds they had planted grow into food-bearing plants. Food grown in the garden is shared among those who work there. Harry, a volunteer, told me that he was growing peas, and courgettes in the garden. He said he wanted to practise healthy eating, so he would be eating the things he grows. He said he had taken home potatoes and other vegetables from the garden in the past.

Connections between nature and people are also evident in the way in which the garden is managed. Most of the management decisions are made by the three members of staff in the garden, all of whom display a degree of ecological embeddedness (Whiteman & Cooper, 2000). Hence, weed killers are not used in the garden, while careful attention is paid to composting, recycling and reusing of materials. The garden is managed with an awareness of the ecological effects of decisions.

Implications of the “Play Factor”

This research builds on the work of others, who have also used creative and participatory approaches to research in organisations. Brown et al. (2017) has pointed out how participatory approaches can contribute to understanding and bring new perspectives to an area of inquiry, and are particularly valuable in stimulating action, producing solutions-orientated work. Kaptani (2008) highlighted the richness of embodied, illustrative data which can be delivered through creative approaches and Tofteng (2011) brought attention to the value of performance in disseminating knowledge and experiences which may otherwise go unheard. Our research study in the community garden illustrates how a creative approach can stimulate research participant dialogue around wellbeing, social and environmental change, and how it can encourage reflexivity in the researcher and in participants.

“The Play’s the Thing”

24

1
2
3 As the backstage story of this research reveals, engaging with the development of a
4 performance piece has contributed to every part of the process. From the outset, a playful
5 element was introduced to the research environment, as I introduced Jimmy to staff and
6 volunteers at the garden and explained our purpose. The novelty of this piqued the interest of
7 our participants and led to relaxed discussions. Huizinga (1950) contended that, as a
8 voluntary activity, play has a unique quality of freedom. It is this quality of freedom which
9 was perhaps invoked when we introduced this project as part of the development of a play.
10 People contributed because the project captured their interest and appeared likely to be fun.
11 They felt an intrinsic desire to take part, as well as a perhaps more commonly experienced
12 moral obligation to contribute to research.
13
14
15
16
17
18
19
20
21
22
23
24
25

26 Participants were encouraged to be reflexive as they related their narratives through
27 interviews, conversations and entries in the sketchbook. As Page et al. (2014) have
28 demonstrated, arts-based approaches can create liminal spaces where emotional experiences
29 can be accessed and communicated. The sketchbook offered an arts-based opportunity to
30 engage creatively in the research. It also facilitated collaboration, as it was available in the
31 garden for participants to see and reflect on each other’s entries. Additionally, as the research
32 took place in the site under investigation, sensory-emotional aspects of experience were
33 always at the fore. These factors, combined with the quality of freedom generated by the
34 concept of the play, created an ‘aesthetic workspace’ (Sutherland, 2013). In this space,
35 participants engage in ‘aesthetic reflexivity’ (Sutherland, 2013) in which “aesthetic products
36 and activities have emergent properties that arise through interactions between people/groups
37 and artistic products/events”(p.27).
38
39
40

54 The complex, situated narratives emerging from ‘aesthetic reflexivity’ (Sutherland,
55 2013) helped to express the connections formed in the garden, both interpersonally and
56 between people and other living things. This theme of connectedness, arising from ‘concrete’
57
58
59
60

“The Play’s the Thing”

1
2
3 situations (Shotter & Tsoukas (2014) was much more revealing than the general themes
4
5 arising from my initial analysis of the interview transcripts. Although the idea of
6
7 connectedness features in each of two frameworks used to explain the mechanisms of green
8
9 care (Bragg and Atkins, 2016; Cutcliffe & Travale, 2016), only one of these (Cutcliffe and
10
11 Travale, 2016) includes “connectedness” with non-human elements of the environment.
12
13 Narratives explored in this study illustrate the role of connectedness, both with other people
14
15 *and* with different living organisms, in community gardening’s impacts on wellbeing.
16
17
18

19
20 As the inquiry progressed and I interacted and connected with Jimmy, with the
21
22 research participants and with the garden, my role as a researcher evolved. During
23
24 discussions with Jimmy about the themes which may run through the play, I became aware of
25
26 the multiple ways in which I related personally to the research participants, as I voiced
27
28 strong, personal opinions about avoiding clichéd stereotypes. As the vignette describing my
29
30 first encounter demonstrates, my initial decision to work in this particular garden was very
31
32 much influenced by a feeling of familiarity with the environment surrounding the garden. I
33
34 grew up in a similarly “deprived” area to this one. I identify as having come from a “working
35
36 class” background.” I’ve also lived with someone who suffered from severe mental illness
37
38 and have had, in common with many other people, mild concerns about my own mental
39
40 health.
41
42
43
44

45
46 These personal experiences informed my interactions with research participants, as I
47
48 was able to understand references they made to their own experiences, and display affinity
49
50 and empathy. For example, when a participant spoke of her relationship with natural spaces,
51
52 she mentioned the places where she played in her youth, and I shared with her my own,
53
54 similar experience of playing in areas of scrap ground around my childhood home. On
55
56 another occasion, when a participant described the garden as a haven where relationship
57
58 difficulties related to mental health issues could be escaped, I think it was clear from my
59
60

“The Play’s the Thing”

26

1
2
3 expression and body language that I had first-hand knowledge of similar situations. These
4 similarities between myself and my research participants made it possible for us to relate to
5 each other. As frank communication developed and progressed, I moved towards a position
6 as an insider in the garden, from that of relative outsider. The notion of ‘hyphen-spaces’ is
7 described by Cunliffe and Karunanayake (2013) as spaces in which researcher identity shifts
8 in relationships with others. I navigated the ‘hyphen space’ (Cunliffe & Karunanayake, 2013)
9 between insiderness and outsiderness as I became increasingly engaged with the participants
10 and lost some of the distance from them which my position as a researcher initially imposed.

11
12 As well as sharing similarities with my research participants, I had a clear
13 understanding of the ways in which we were different. During our conversations about the
14 development of a play, Jimmy and I agreed on the importance of creating characters who are
15 unique individuals, and not stereotypes signifying categories of difference, such as “working
16 class”, “deprived”, or “suffering from mental illness”. The importance of thinking of people
17 in this way was highlighted by the process of considering how to create authentic
18 fictionalised characters. It also influenced the way I carried out my interviews and
19 interactions with participants, and the ways in which I analyse and present results.

20
21 As McDonald (2013) states, the “fluid, shifting nature of identities” (p. 127)
22 highlighted by queer theory is such that labels denoting categories of difference may mask
23 important differences and similarities. I was able to identify with some aspects of my
24 research participants’ identities, but I was not “the same” as them, any more than they were
25 “the same” as each other. As I progressed through the inquiry then, I constantly negotiated
26 the ‘hyphen space’ (Cunliffe & Karunanayake, 2013) between sameness and difference.
27 The experiences of the research participants were not my experiences, although many of them
28 resonated with me. There is a risk that I could project my own experiences onto theirs,
29 conflating them and losing the unique aspects of tacit knowledge which I was aiming to

27

1
2
3 surface. Working in collaboration with Jimmy and with the staff and volunteers at the garden,
4
5 as co-researchers offered some safeguards against this risk. We were conducting the inquiry
6
7 from a variety of perspectives and I was also able to compare the opening section of Jimmy’s
8
9 script with my own impressions of the garden.
10
11

12
13 Nevertheless, it was vital that I engage with self-reflexivity, constantly examining my
14
15 reactions to and interpretation of narratives and events. This was facilitated when I examined
16
17 and retold moments in which I was emotionally ‘struck’ (Cunliffe, 2002), such as on my first
18
19 entrance into the garden. As I narrated this experience as a vignette, I evoked emotions
20
21 related to it (Corlett, 2013). By returning to this moment, I was able to engage in critical self-
22
23 reflexivity, examining my emotional responses, my ways of making meaning and how I
24
25 related to the situation and to a research participant (Carol). These cycles of reflexivity were
26
27 carried out throughout the research process.
28
29

30
31 The process culminated in Jimmy’s creation of a script for the opening section of a
32
33 play, which received a favourable response from staff and volunteers at the garden. We hope
34
35 the play will be performed when completed, in the community garden and other venues.
36
37 Participants’ voices will thereby be amplified and communicated (Brown et al., 2017).to
38
39 people who could benefit from taking part in similar activities, as well as to health and social
40
41 care providers and urban planners, who may be able to further harness the benefits of urban
42
43 nature in promoting wellbeing. As Sutherland (2013) suggests, reflexive work can create
44
45 "memories with future resonance and momentum" (pg.37). If we can create such memories in
46
47 our audience, we may raise awareness of community gardening and spark future actions to
48
49 promote it.
50
51

52
53 I began this research believing that community gardening was likely to be a valuable
54
55 resource in the promotion of wellbeing. The experience of carrying out the research has
56
57 strengthened this belief. As a result, I have travelled some way across the ‘hyphen space’
58
59
60

1 “The Play’s the Thing”

28

2
3 (Cunliffe & Karunanayake, 2013) between political activism and active neutrality, in the
4
5 direction of political activism. I wish to generate interest and action around community
6
7 gardens and green care, so that benefits can be realized by more people. In this endeavor,
8
9 arts-based methods have added value over more traditional methods, both in fostering the
10
11 emergence of ‘memories with momentum’ (Sutherland, 2013) and in communicating widely
12
13 with diverse audiences (Nair et al., 2018).
14
15
16

17
18 Adaptive, creative approaches to doing and disseminating research can facilitate
19
20 discourse which embraces the dynamic complexity of living organisations (Brown et al.,
21
22 2017). There are, of course, other areas of management and organisation research to which
23
24 these approaches could apply. For example, in the field of human resource management, a
25
26 creative approach may enhance the exploration of employee wellbeing programmes or
27
28 attempts to make working environments family friendly. They could also be valuable in
29
30 researching the effectiveness of policies on equality and inclusion in the workplace.
