The importance of key supplier relationship management in supply chains

Purpose: This paper investigates the impact of key supplier relationship management (KSRM) - understood as an aggregated supply chain management (SCM) process in the upstream direction - on the overall level of the execution of SCM within organizations.

Methodology: A conceptual model is developed from a theoretical framework and proposes the capability to do KSRM as a mediator between internal and external SCM resources and SCM execution. A survey of 174 managers representing different supply chain stages is used to test the model through variance-based structural equation modelling.

Findings: The findings reveal that external SCM resources directly affect the capability to do KSRM. Nevertheless, internal resources show a considerable indirect impact through external resources and can thus be considered an indirect determinant. The capability to do KSRM in turn impacts upon the level of SCM execution, measured in terms of the integration of business processes, directly and substantially, as well as mediating the effect between SCM resources and the level of SCM execution.

Value: The main contribution of this paper is to empirically demonstrate the potential of KSRM for enhancing the level of SCM execution within organizations and consequently the level of integration in supply chains, leading to higher customer and shareholder value.

Keywords: Supplier management (relations), supply chain management, partial least squares

Article Classification: Research paper

Introduction

Interorganizational relationships play a major role in marketing channels (e.g., Jüttner and Peck, 1998). Thus, Krapfel *et al.* (1991) suggested, quite early on, a strategic approach for managing this type of partnership. Taking fashion retailing as one example, supplier management is seen as a means to achieve supply chain responsiveness (Doyle *et al.*, 2006). Taking into account that the number of suppliers of such companies ranges from a few hundred to many thousands (Statista, 2015), the focus on those suppliers that are very important to the overall success of a retailer, is essential (e.g., Lindgreen *et al.*, 2013).

Over the past 20 years, academic research, for example in the fields of supply chain management, purchasing and marketing, has examined how value is created from close buyer-supplier relationships (for an overview see e.g., Hingley *et al.*, 2015). From a retailer's perspective, Corsten and Kumar (2005) have shown how suppliers can benefit from retailer-specific supplier management approaches which are based on cooperative relationships.

Within the business-to-business relationship literature, this has been widely discussed under the umbrella term of 'buyer-seller relationships'. Lately, Forslund (2014) has shown how the level of logistics performance depends on the quality of the relationships between retailers and their suppliers. Hamister (2012) has shown that strategic retail supplier partnerships positively affect key supplier performance.

Overall, supply chains include upstream as well as downstream relations with customers and suppliers, and supply chain managers have to decide whether or not to work with upstream and downstream partners, as well as the degree of exchange they want to have with these partners (Giannakis and Louis, 2011). These decisions refer to the strategic dimension of supply chain management (SCM), i.e. the 'co-ordination of a strategic and long-term co-operation among co-makers in the total supply chain for the development and

1
2
3 production of products, both in production and procurement and in product and process
4 innovation' (Schnetzler and Schönsleben, 2007, 498; see also Howgego, 2002).
5
6

7 In the following, we want to concentrate on the management of relationships with
8 those suppliers that organizations consider to be very important, or key suppliers. We define
9 key supplier relationship management (KSRM) as the management of familiar relationships
10 between a company and a supplier, in which the two parties share a significant level of
11 business process integration and view themselves as an extension of their firms (Lambert *et*
12 *al.*, 1996). In that sense, key supplier relationships are recognized as high involvement
13 relationships in which the benefits outweigh the costs of being in the relationship (Lambert *et*
14 *al.*, 1996; Gadde and Snehota, 2000). This differentiated view on supplier relationships and
15 their management allows firms to achieve the advantages of being responsive, agile, fast and
16 profitable (Doyle *et al.*, 2006).

26
27
28
29

30 Given the importance of KSRM for successful SCM, this paper is concerned with
31 aspects of KSRM in the upstream or supplier direction, and considers it as a highly
32 aggregated business process (Lambert, 2010), as opposed to the view that it may be separated
33 into further sub-processes proposed by Park *et al.* (2010), for example.
34
35
36
37
38

39 So far, the relevant literature has provided limited support and empirical evidence for
40 the importance of KSRM for SCM and its execution. Recently, Miocevic and Crnjak-
41 Karanovic (2012) showed how KSRM practices leverage on the link between supply chain
42 orientation and organizational buying effectiveness. Further, Teller *et al.* (2012) found some
43 indication of the importance and relevance of KSRM to the overall explanation of supply
44 chain execution and its power to improve the level of implementation of SCM within an
45 organization. Forslund (2014) identified a positive outcome for logistics performance if
46 retailers manage their supplier relationships adequately. She looked, however, at the effect of
47 KSRM on SCM and not so much at the inputs to KSRM.

1
2
3 Based on these preliminary findings regarding KSRM's potential for SCM, this
4 paper aims to (1) investigate how the execution of SCM resources within a firm affects its
5 capability to do KSRM and (2) determine the impact of KSRM on the level of the execution
6 of SCM within an organization. In this context, we define capability as the ability of a firm to
7 marshal and use its resources to effect a desired output change, as opposed to the firm
8 possessing within it the competence to actually do so (Loasby, 1998; Penrose, 2009).
9 According to Kähkönen and Lintukangas (2012), capabilities in a supply chain context help to
10 create superior performance as well as customer value. This may also include - through
11 supplier relationship management - the involvement of suppliers in certain core processes
12 such as new product development (Kotzab *et al.*, 2015).
13

20
21
22
23
24

25 Thus, the value of this paper is that it provides further understanding and explanation
26 of KSRM's role as a crucial SCM process, as well as pointing out the necessity of focusing on
27 the management of upstream supply chain relationships and their importance for overall
28 supply chain performance. To achieve these research aims, we present the following line of
29 argumentation in our paper.
30
31
32
33
34
35

36 After this introduction, in which we have shown the relevance of KSRM as an integral
37 part of SCM, we present a conceptual model and hypotheses for SCM and KSRM, and our
38 methodology for the research study. An analysis and discussion of the study findings follows,
39 and the paper is rounded off with implications for future research.

46

47 **Conceptual model**

48
49

50 Due to the limited amount of empirical research on the relationship between KSRM and the
51 execution of SCM and due to the absence of a measurement scale for KSRM, we focus here
52 on the core element of supplier-related relationship management, which is the fundamental
53 capability of supply chain partners to set up relationships with their core strategic partners.
54
55
56
57
58
59
60

1
2
3 This refers to the planning and implementation element of the KSRM process (Choi and
4
5 Hartley, 1996, Liker and Choi, 2004) and is labelled the 'capability to do KSRM' .
6
7

8 The literature sees the capability to do KSRM as an SCM-related process (Lambert *et*
9
10 *al.*, 2005) that supports the integration of processes between upstream supply chain partners
11
12 on a strategic level (Krapfel *et al.*, 1991; Hogarth-Scott and Parkinson, 1993; Lambert *et al.*
13
14 1998; Kotzab *et al.*, 2011; Hamister, 2012). More specifically, Teller *et al.* (2012) provided an
15
16 empirical indication that the capability to do KSRM - over and above other SCM-related
17
18 processes - plays a substantial role in changing the level of the execution of SCM within an
19
20 organization. Based on Kotzab *et al.* (2015) SCM execution we define as the implementation
21
22 of SCM within a firm and thus as the level of a firm' s internal and external integration of
23
24 business processes with customers and suppliers for the purpose of creating value and
25
26 improving the total performance of the supply chain (Lambert *et al.*, 1998; Frohlich and
27
28 Westbrook, 2001; see appendix). Based on the tight link between relationship management -
29
30 and as such KSRM - and the level of implementation of SCM within an organization, or
31
32 execution of SCM (Olsen and Ellram, 1997; Lambert, 2010), we thus hypothesize that:
33
34
35

36 *H_{1/γ13}: The greater the capability to do KSRM (ξ₃), the higher is the level of SCM execution*
37
38 *(η₁).*
39
40

41 Earlier we defined key supplier relations as high-involvement relationships. Looking
42
43 at the various phases of a relationship development process, as suggested by Dwyer *et al.*
44
45 (1987), we consider such relationships to be at the fourth stage, that is, the commitment level,
46
47 by which point the partners have shared values and governance structures as well as having
48
49 made joint investments in the relationship. Heide (1994) called this kind of cooperation a
50
51 form of bilateral non-market governance in the stage of relationship maintenance, with long-
52
53 term incentive systems, joint activities, team responsibilities and a mutual interest in
54
55 continuing the relationship.
56
57
58
59
60

1
2
3 SCM processes and thus the capability to do KSRM are determined by the internal
4 'fitness' of a firm, and in the following are labelled as internal SCM-related resources (Kotzab
5 *et al.*, 2015). Such resources are essential to the enabling of SCM-related processes and the
6 execution of SCM (e.g., Lambert, 2004). Internal SCM-related resources are provided from
7 within an organization and do not necessarily require collaboration with other supply chain
8 partners. They include resources such as top management support, human and financial
9 resources, internal goal setting before commencing work on SCM projects, the ability of the
10 staff to use SCM-related IT systems, and those systems' appropriateness, internal guidelines
11 for data exchange with supply chain partners, personnel who are trained to contribute to SCM
12 projects, cross-functional project groups for SCM, the expertise to set up supply chain
13 partnerships and the willingness within the organization to integrate with other supply chain
14 partners (Boeck and Fosso Wamba, 2008; Sandberg and Abrahamsson, 2010; see appendix).
15
16 These resources of supply chain partners are used to strengthen relationships within supply
17 chains and thus - in combination with other SCM-related processes - enable firms to do
18 KSRM (Lambert *et al.*, 1998). By drawing on Droge *et al.*' s (2004), Sandberg and
19 Abrahamsson' s (2010) and Hamister' s (2012) notions on the role resources play in creating
20 capabilities in the supply chain that can ultimately enhance competitiveness, we propose that
21 these internal SCM resources are prerequisites and thus antecedents of the capability to do
22 KSRM, leading to our second hypothesis:

23
24

58
59
60
greater is its capability to do KSRM (ξ₃).

Internal SCM resources are closely related to a firm being externally 'fit' for SCM,
in other words to the existence of external SCM-related resources (Droge *et al.*, 2004).

External resources - unlike internal ones - result from coordination and collaborative
activities between supply chain partners (Kotzab *et al.*, 2015). Examples are collaboration

1
2
3 agreements with other supply chain partners, interorganizational project groups,
4
5 interorganizational information systems, awareness of decision-related interdependencies
6
7 between organizations, mutual trust, the existence of long-term relationships with other
8
9 supply chain partners, an equal distribution of power, risks and benefits in the chain, mutual
10
11 dependencies, the exchange of information on stock levels, forecasting and product
12
13 development, and similarities in corporate cultures and decision-making processes (Prajogo
14
15 and Olhager, 2012; Hingley, 2005; Theodoras *et al.*, 2005; Boeck and Fosso Wamba, 2008;
16
17 Bobot, 2011; Forslund, 2014; see appendix). Lambert (2004) proposed a close link between
18
19 the existence of external SCM resources - as operationalized above - in an organization and
20
21 the capability to execute SCM processes such as KSRM. Based on Lavie' s (2006) notions on
22
23 (shared) resources being a driver of network relationships and a key element of network
24
25 alliances, we thus propose:
26
27

28
29
30 *H₃/γ₃₂: The more external SCM resources are made available in an organization (ξ₂), the*
31
32 *greater is its capability to do KSRM (ξ₃).*
33
34

35 Both internal and external SCM resources are seen to affect the SCM execution level
36
37 - in the same way as they affect the capability to do KSRM directly (Lambert *et al.*, 2005;
38
39 Corsten and Kumar, 2005; Miocevic and Crnjak-Karanovic, 2012). Also, following Lambert' s
40
41 (2004, 2010) view of a hierarchical order, internal SCM resources may affect external SCM
42
43 resources directly as well (γ₂₁). Nevertheless, these effects are not of primary importance
44
45 when investigating the role of KSRM in SCM execution and are thus not at the centre of the
46
47 following empirical evaluation and subsequent discussion of the role of KSRM.
48
49

50 The proposed linkages between the three hypotheses build a conceptual model which
51
52 posits that the capability to do KSRM plays a central role in influencing the level of execution
53
54 of SCM. The integral role of KSRM, as part of other SCM-related processes, was proposed
55
56 and discussed by Lambert (2004) and Kotzab *et al.* (2006a). So far, though, the literature has
57
58
59
60

1
2
3 provided no empirical proof of KSRM's power to mediate between internal and external SCM
4 resources and SCM execution. Thus, we propose the following final two hypotheses:

5
6
7 *H_{4a}: The capability to do KSRM significantly mediates the effect of internal SCM resources*
8
9 *on the execution of SCM (γ_{11}).*

10
11
12 *H_{4b}: The capability to do KSRM significantly mediates the effect of external SCM resources*
13
14 *on the execution of SCM (γ_{12}).*

15
16
17 To test the significance of our KSRM construct in terms of being an antecedent and providing
18 the leverage for SCM execution, we undertook an empirical study, the methodology of which
19
20
21
22 is detailed in the following section.

23 24 25 **Methodology**

26 27 28 ***Empirical research design***

29
30
31
32 In order to empirically investigate our conceptual model and test our hypotheses, we
33
34 conducted a survey targeting the senior managers of large organizations in the manufacturing,
35
36 trade and service industries. A structured, self-administered questionnaire, containing 45
37
38 questions using nominal and ordinal scales, served as the research instrument.

39
40
41 Due to excellent access opportunities to organizations and the high level of SCM
42
43 implementation in Austria, we defined our population of interest as the 790 biggest Austrian
44
45 organizations in the retail and manufacturing sectors as per the ÖNACE classification. This
46
47 empirical research setting accounts for a typical central European and highly developed
48
49 supply chain environment. From that population, we selected 200 organizations at random. To
50
51 minimize the negative consequences of common sources of survey errors - in particular non-
52
53 response error - we followed the tailored design method (TDM) proposed by Dillman *et al.*
54
55
56
57 (2009). We pre-notified potential respondents over the phone, not only in order to gain their
58
59
60

1
2
3 commitment to participate in the survey but also to ensure their suitability as informants, that
4 is, that they were senior managers responsible for logistics and SCM. As we understand our
5 problem as an interorganizational one, we opted for a single-informant approach, referring to
6 Kumar *et al.* (1993). We solved the selection problem by choosing senior logistics and supply
7 chain managers as the respondents. We deemed them appropriate due to the very specific
8 nature of our questions and thus the high level of expertise, along with access to very specific
9 information, required to answer them. This approach is also in line with the notions of Huber
10 and Power (1985), as the managers selected were the most knowledgeable and experienced in
11 terms of the phenomenon of interest. Furthermore, the problem of disagreements in the data
12 as a result of the different knowledge and perceptions of the key informants was reduced.

13
14
15
16
17
18
19
20
21
22
23
24
25 The survey was then sent by mail to the selected respondents representing the 200
26 selected organizations. After several extensive waves of reminding and motivating the
27 identified informants to complete our survey, we ended up with 174 usable questionnaires,
28 making a response rate of 87%.

29
30
31
32
33
34 The final sample (n, 174) consisted of senior managers representing manufacturing
35 companies (39%), trading companies (29%) and other organizations belonging to the service,
36 building and energy sectors (32%). Comparing the industry affiliations of the respondents
37 with the distribution of industry affiliations in the random sample, we found no significant
38 difference (Chi-squared test: 2.811; $p > 0.05$). Thus we can conclude that our sample represents
39 the population of interest sufficiently well. Finally, it is worth mentioning that our
40 respondents had, on average, been with their organizations for more than 12 years (standard
41 deviation (s), 11.5) and in their current job role for 5.6 years on average (s, 6.1). We can thus
42 conclude that the answers to our questions are based on several years' experience within the
43 organizations in question and within the field of logistics and supply chain management.

Applied scales and analysis

The conceptual model was tested based on the scales developed by Kotzab *et al.* (2006a, 2006b), who provided detailed descriptions of the various items standing behind the constructs. Details on the scales behind the constructs internal and external SCM resources as well as SCM execution together with the related literature can be found in the both the conceptual model section and the appendix.

We measured internal/external SCM resources and the execution of SCM reflectively. We draw support for this decision from the notions of Jarvis *et al.* (2003): We consider the direction of causality from the latent construct towards the indicators for all of our constructs. This is of particular importance for our dependent construct SCM execution, given Lee and Cadogan's (2013) critique on treating formative constructs as dependent ones. Based on previous work applying those scales (e.g., Kotzab *et al.*, 2006a, Kotzab *et al.*, 2006b), we expected the items behind each of the constructs to be correlated. Furthermore, we saw a surplus meaning of the construct on top of those of the indicators, and consequently we did not deem that a scale score based on the indicator ratings would adequately represent the constructs. Finally, discarding any of the indicators behind the constructs would not change the meanings of the constructs themselves.

The capability to do KSRM was measured by a single-item construct and was based on Lambert *et al.*'s (1998) discussions of KSRM-related processes as a central part of SCM. The rationale behind this decision was that KSRM as a concept has not received considerable attention in the literature, nor has it seen wide implementation in practice. Furthermore, we consulted the decision guidelines on applying single versus multi-item scales in management research, proposed by Fuchs and Diamantopoulos (2009). According to those, we can be confident in using a single-item measurement approach for the capability to do KSRM because (1) the construct has a quite concrete and one-dimensional nature, (2) the primary

1
2
3 research objective is to gain a general and explorative view of the construct' s role within the
4
5 concept of SCM, (3) the sample population is quite diverse and (4) the sample size is rather
6
7 limited, due to the challenge involved in motivating SCM executives to participate in such
8
9 studies. Consequently, we argue, in line with Hair Jr *et al.* (2009), that, if a construct with
10
11 only one measure is acceptable, then any related models are therefore acceptable, along with
12
13 any conclusions drawn.
14

15
16 To test the proposed hypotheses, we applied variance-based structural equation
17
18 modelling (SEM) using partial least squares (PLS) (Chin, 1998; Tenenhaus *et al.*, 2005), with
19
20 the help of the software SmartPLS (Ringle *et al.*, 2015). Compared to covariance-based SEM
21
22 approaches, the PLS approach has several advantages related to the level of measurement and
23
24 multinormality (Hair Jr *et al.*, 2012). We specifically applied the variance-based approach
25
26 because we were testing a rather complex model based on a relatively small sample (Chin and
27
28 Newsted, 1999). Further, we were not attempting to test a theory but to predict SCM-related
29
30 antecedents of KSRM, and the impact of KSRM on SCM execution (Hair Jr *et al.*, 2011).
31
32 Lastly, our study has a quite exploratory character and thus requires a variance-based rather
33
34 than covariance-based SEM approach (Hair Jr *et al.*, 2011).
35
36
37

38
39 When looking at the results of our tests of the measurement validity of our
40
41 constructs, we can see that all factor loadings are highly significant ($p < 0.001$) (see Appendix).
42
43 Their sizes exceed or are very close to the suggested threshold of 0.70 (Hulland, 1999). The
44
45 internal consistency of all the constructs can also be considered satisfactory, with both the
46
47 Cronbach' s alpha and the composite reliability values greater than 0.70 (Nunnally, 1978;
48
49 Fornell and Larcker, 1981). The average variances extracted (AVEs) are in the range of 0.5 or
50
51 higher, meaning that the degree of convergent validity is acceptable (Bagozzi and Yi, 1988).
52
53 For all constructs, the AVE is larger than the highest of the squared intercorrelations with the
54
55 other constructs in the measurement model, which means that they are sufficiently
56
57
58
59
60

1
2
3 discriminant from each other (see Table 1). When examining the cross-loadings, we can see
4
5 that all factor loadings on the assigned construct are higher than all loadings on the non-
6
7 assigned constructs (Chin, 1998; Hair Jr *et al.*, 2014). We can thus conclude that there is a
8
9 sufficient local fit of the data and that the two resource constructs are sufficiently discriminant
1
11 from each other.

12
13
14 -----
15 *Insert Table 1 here*
16 -----

17
18 To determine whether industry affiliation had a significant impact on our results, we
19
20 introduced a control variable (service/retail and non-service/retail-related affiliation) into our
21
22 model. We found the impact of our control variable to be insignificant (*t*-value, <<1.96) and
23
24 controlling for this variable did not alter the significance levels of our proposed effects as
25
26 presented in the following section.

27
28 Since we had gathered the data based on self-reports, we considered the issue of
29
30 common method bias by following the notions of Podsakoff *et al.* (2003). In terms of the
31
32 structure of the research instrument, we clearly separated the questions. Further, we did not
33
34 reveal the specific purpose of our project and assured confidentiality to our respondents.
35
36 Finally, we conducted a confirmatory factor analysis subsuming all indicators under one latent
37
38 construct, that is, a common method variance factor. The resulting model showed a
39
40 suboptimal global fit with the empirical data (root mean squared error of approximation,
41
42 0.116 (cut-off value: <0.05); Tucker-Lewis index, 0.719 (cut-off value: >0.9); comparative fit
43
44 index >0.738 (cut-off value: >0.9); CMIN/df, 3.313 (cut-off value: <2)), indicating that our
45
46 results are not affected by common method bias.

Results

Model estimation

The interpretation of the coefficients of determination (r^2) indicates that almost two thirds of the variance of the construct external SCM resources (ξ_2) is explained by the internal resources (ξ_1) (r^2 , .647). Both types of SCM resources (ξ_1 and ξ_2) explain the capability to do KSRM (ξ_3) by slightly less than one third (r^2 , .229). Finally, the construct SCM execution (η_1) exhibits an r^2 value of 0.364, meaning that all three constructs (ξ_1 , ξ_2 and ξ_3) contribute considerably to the explanation of the variance of this construct.

Interpreting the direct effects exclusively, we can see that the internal SCM resources (ξ_1) significantly and substantially affect the external SCM resources (ξ_2) (γ_{21} , .804; $p < .001$) whereas the impact on SCM execution (η_1) is significant but weak (γ_{11} , .242; $p < .05$). The internal resources show no significant effect on the capability to do KSRM (ξ_3) (γ_{31} , .050; $p > .05$).

The external SCM resources (ξ_2) affect SCM execution (η_1) only slightly, with the effect being significant but weak (γ_{12} , .238; $p < .05$). They also show a significant medium-sized effect on the capability to do KSRM (ξ_3) (γ_{32} , .437; $p < .01$), which in turn significantly affects the execution of SCM (η_1), also with a medium-sized effect (γ_{13} , .237; $p < .001$). To conclude, we can confirm hypotheses H₁ (capability to do KSRM (ξ_3)-7execution of SCM (η_1)) and H₃ (external SCM resources (ξ_2)-7capability to do KSRM (ξ_3)) but not H₂ (internal SCM resources (ξ_1)-7capability to do KSRM (ξ_3)) when exclusively interpreting the direct effects.

Taking into account the total effect, by additionally considering the indirect effects between constructs and thus considering (partial) mediating effects, we find that the internal SCM resources (ξ_1) have significant and strong effects on both the capability to do KSRM (ξ_3)

(.402; $p < .01$) and the execution of SCM (η_1) (.529; $p < .001$), while the external SCM resources (ξ_2) also affect the execution of SCM (η_1) significantly and substantially (.342; $p < .001$). These results again support hypotheses H₁ and H₃ but also suggest confirming H₂ in terms of an internal SCM-resources having an indirect rather than a direct effect on the capability to do KSRM.

Mediation test

To test for mediation by our core construct capability to do KSRM (see H_{4a} and H_{4b}), we applied Baron and Kenny's (1986) four-step procedure: Firstly, we tested the direct effect between the two constructs of SCM resources (ξ_1 and ξ_2) and SCM execution (η_1). Both resource constructs show a significant effect on SCM execution (ξ_1 - η_1 , .535^{***}; ξ_2 - η_1 , .551^{***}). Secondly, we evaluated the effects between the resource constructs and the mediator, and obtained significant results (ξ_1 - ξ_3 , .419^{***}; ξ_2 - ξ_3 , .482^{***}). Thirdly, we assessed whether the proposed mediator affects the endogenous constructs. The effect is again significant (ξ_3 - η_1 , .447^{***}). Finally, we examined the indirect effects (ξ_1 - ξ_3 - η_1 , ξ_2 - ξ_3 - η_1) and tested whether they were different from zero, by applying Sobel's test (1982). We found Sobel's z to be 4.916 for the indirect effect of the internal SCM resources construct and 5.429 for the external SCM resources construct; thus, we conclude that the indirect effects are significantly different from zero.

Further to the abovementioned four steps, we calculated the size and strength of the mediating effects by using the measure 'variance accounted for' (VAF), based on Shrout and Bolger's (2002) formula. We found the VAF value of the mediated construct internal SCM resources to be 0.259 and that of external SCM resources to be 0.281. Thus, we found the mediating power of our KSRM construct to be medium-sized. Having obtained significant results in each of the four steps, we can confirm both H_{4a} and H_{4b} and conclude that the

1
2
3 effects of SCM internal and external resources on SCM execution are significantly mediated
4
5 by the capability to do KSRM.
6
7

8 9 **Discussion and conclusions**

10
11 In this research, we have specifically discussed and empirically evaluated the link between
12
13 resources in vertical network partnerships related to supply chain partnering, and the
14
15 capability to manage upstream relationships with important stakeholders or key suppliers and
16
17 subsequently increase the level of SCM execution within the organization. The paper thus
18
19 makes several contributions to theory and practice:
20
21

22
23 One main contribution is that we have provided empirical evidence on the tight link
24
25 between SCM resources and network capabilities such as relationship management - in our
26
27 case upstream with suppliers, in what we term KSRM. This finding is in line with Lavie' s
28
29 (2006) view on the contribution of non-shared and shared resources to interfirm networks,
30
31 their integration, and subsequently their competitive advantage. It also confirms the notions of
32
33 Corsten and Kumar (2005), who showed how retailers in the consumer goods industry can
34
35 gain benefit from collaborative relationships with their suppliers. In our paper, we have
36
37 extended the view to other industries and shown which generic internal and external resources
38
39 impact such collaborative relationships, across industries and supply chain stages.
40
41

42
43 We have shown that internal SCM resources represent an indirect determinant, and
44
45 external SCM resources are a direct requirement and thus antecedent, of a firm' s capability to
46
47 do KSRM. This finding provides support for Lambert' s (2004) hierarchical order and
48
49 emphasizes the importance of preparing an organization internally for supply chain partnering
50
51 and KSRM, and then developing collaborative resources with supply chain partners, in order
52
53 to render the organization capable of doing KSRM. This finding also complements the
54
55 notions of Miocevic and Crnjak-Karanovic (2012), who saw a more general supply chain
56
57
58
59
60

1
2
3 orientation - along with SCM resources - as the prerequisites of KSRM. For practice, this
4
5 finding emphasizes the necessity that supply chain partners be fit for SCM internally, and
6
7 then (more importantly) externally, in order for organizations to be capable of following the
8
9 principle of the 'keyness of relationships' on the supply side (Ivens *et al.*, 2009).
10

11
12 Another main contribution of this paper is that we have found that the capability to
13
14 do KSRM is a core requirement for increasing the level of SCM implementation within a
15
16 company. This supports Teller *et al.*'s (2012) work, which found that KSRM is a core SCM-
17
18 related process. This substantial effect also supports the central role played by relationship
19
20 management in general, and supplier relationship management specifically, in the integration
21
22 within vertical interorganizational networks, as proposed by Paulraj *et al.* (2012) and
23
24 Hamister (2012). As a consequence, looking upstream in terms of relationship management
25
26 with key suppliers, the latter can be considered an important success factor for SCM, albeit
27
28
29
30 not the only one (Hogarth-Scott and Parkinson, 1993; Hamister, 2012; Forslund, 2014).
31
32 However, the relevance of KSRM for supply chain partnering in this study stems from the
33
34 strong and substantial mediation, and consequently leveraging, of the relationship between
35
36 getting the firm internally and externally fit for SCM, and executing SCM (Lambert, 2004;
37
38 Hingley, 2005; Bobot, 2011). As we have found a considerable link between the capability to
39
40 do KSRM and SCM execution, we conclude - based on the notions of Frohlich and
41
42 Westbrook (2001) and Li *et al.* (2006) - that it is KSRM that ultimately and indirectly drives
43
44 the performance of firms. This conclusion clearly underlines the importance of the practice of
45
46 relationship management within the supply chain, downstream towards customers, but more
47
48 particularly upstream towards suppliers.
49
50

51
52 The findings of our study also support the bidirectional character of SCM, as noted
53
54 by authors such as Cousins and Menguc (2006). From a practical point of view the results
55
56 clearly indicate the need for supply chain managers to focus their collaborations upstream as
57
58
59
60

1
2
3 well as downstream, and by doing so to develop and maintain the focal firm's collaborative
4 relationships with both customers and suppliers. Our findings support the required demand-
5 side perspective.
6
7

8
9
10 In summary, given the limited state of the KSRM literature, our explanatory findings
11 call for a stronger consideration of the concept in SCM and service research. Firms should
12 look upstream as well as downstream when developing relationship management within their
13 supply chains.
14
15
16
17

18 19 20 **Limitations and future research**

21
22 As with all research, there are some limitations in this study. Despite the fact that the context-
23 specific characteristics of the Central European supply chain setting in which our empirical
24 study was embedded can be regarded as typical of those in developed economies, the context
25 does need to be taken into account when interpreting the data. Future studies in other settings
26 - for example, developing countries - could help to confirm our findings. Future research in
27 other industries, and focusing on smaller organizations than the ones represented by our
28 respondents, might also stimulate more specific results.
29
30
31
32
33
34
35

36
37
38 The construct of KSRM was operationalized as the key ability to set up relationships
39 with important strategic suppliers. Future research could look beyond that and develop a more
40 comprehensive scale of KSRM, including aspects of maintaining relationships and
41 differentiating between different kinds of key suppliers.

3 **Dear Professor Towers, dear Neil,**
4

5 Again we wish to thank you for the opportunities to revise our manuscript in the light of the
6 reviewers' comments. We also wish to thank the reviewers for their valuable comments. The
7 comments definitely helped us to further improve the quality of the paper. In making our
8 revision, we addressed each individual point raised, as outlined below. To make it most
9 convenient for the two reviewers (and yourself) to find the changes made in response to their
10 comments we refer to the relevant section of the paper and highlight the changes in red in the
11 manuscript.
12

13
14 Best wishes

15
16 The authors
17

18 **AnswerstothecommentsofREVIEWER1**
19

20
21 **Comment RI/1:**

22 1. Originality: Does the paper contain new and significant information adequate to
23 justify publication?: This paper investigates the link between KSRM and overall SCM
24 performance. Based on an Austrian survey the articles concludes that there is a linkage.
25

26 Unfortunately, I **do not think** the findings contains **any new significant information**. In the
27 conclusions, for instance, it is stated that "One main contribution is that we have provided
28 empirical evidence on the tight link between SCM resources and network capabilities such as
2 relationship management". This is not a new thing - I did it myself in a survey study ten years
30 ago that was published in IJLM. Another statement in the conclusions is that "...we have
31 found that the capability to do KSRM is a core requirement for increasing the level of SCM
32 implementation within a company". This finding is not surprising and actually one of the key
33 topics in SCM literature.
34

35
36 As an overall suggestion, and based on my critique above, I think the paper should be **geared**
37 **more towards "only" KSRM**, and less towards the linkage between KSRM and overall
38 SCM. Another thing that I believe supports this is the fact that I miss clear cut definitions of
3 the concepts you are elaborating. What is really KSRM? And what is "overall SCM" or
41 "overall SCM processes" that you are discussing?
42

43 **Answer RI/1:** We thank the reviewer for highlighting that the contribution of our research
44 needs to be tightened. We thank the reviewer to refer to his/her research published in the
45 International Journal of Logistics Management. Unfortunately we were unable to clearly
46 identify this work. Please accept our sincere apologies for that.

47 **Focus of the paper and newness of results:** We do want to stress that our research looks
48 into the effect of the *capability* to do KSRM on the *execution* of SCM – but not SCM in
49 general. We apologise if we did not make that clear enough. In terms of the newness of the
50 results we argue that – to our best knowledge – literature has not yet provided empirical
51 evidence on the link between supply chain *management* resources, *KSRM* and the *execution*
52 of SCM.
53

54 **Definitions:** We also took on board the reviewer's critique on the lack of clear definitions of
55 central terms in the paper. We now clearly define SCM, SCM execution, KSRM, key supplier
56 relationship, capability, and resource in the introductory section.
57
58
59
60

We hope that the paper is now tighter and clearer with respect to the focus and the underlying key concepts.

[See 'Introduction', whole paper]

Comment RI/2:

2. Relationship to Literature: Does the paper demonstrate an adequate understanding of the relevant literature in the field and cite an appropriate range of literature sources? Is any significant work ignored?: You seem to have been reading a lot of interesting literature (although somewhat old in some cases) and you have a lot of references. Many of them are however not **helping you forward towards your aim of the study**. Why have you **not presented and justified your variables investigated in the survey**? You have them in an appendix but there is a gap between the more superficial literature review presented in the manuscript and these variables.

Moreover, I think (but that may be a personal viewpoint) the introduction includes **too many references** that does not lead to the purpose of your study.

Answer RI/2: We completely agree with the reviewer that some parts of the paper were "overreferenced". For that reason we cleared out the references and focused on those which we regard as being of key importance to our argumentation and also reflect the discussion in IJRDM.

[See 'Introduction', whole paper]

Comment RI/3:

Definitions: As I mentioned above, I miss clear definitions of the **key concepts** you are working with, which makes your research findings hard to judge (perhaps this is the reason for why I do not think there are any new information in your research?). For instance, you seem to think that KSRM includes operational processes on p. 3, but later on in the paper you discuss strategic issues of KSRM?

Answer RI/3: According to the reviewer's suggestions we now present clear definitions around the key concepts of our paper. We now clearly define SCM, SCM execution, KSRM, capability and resource in the introduction and the conceptual model section. Furthermore, we provide the required information on the measurement/operationalisation of the constructs in the conceptual model and the applied scales sections.

Regarding your critique on the "operational character" of the process of KSRM, we went back to the work of Lambert et al. (1996). They consider the highest level of partnerships to be amongst parties "who share a significant level of operational integration". Unfortunately they do not define the term "operational integration". We interpreted this as business process integration and consequently show this now in our definition. We hope that this interpretation is satisfactory.

[See 'Introduction'; 'Conceptual model'; 'Applied scales and analysis']

Comment RI/4:

Another thing that I disagree with you is your statement that there is **not literature on KSRM available**. I think there is an awful lot of literature on **supplier relationships**,

1
2
3 **alliances, etc within the SCM literature...**Again, what do you mean when discussing
4 KSRM?

5
6 **Answer RI/4:** Based on the reviewer's comments we now embed our argumentation in the
7 wider literature on buyer-supplier relationships.
8
9

10 [See 'Introduction']
11

12 **Comment RI/5:**

13 3. Methodology: Is the paper's argument built on an appropriate base of theory,
14 concepts, or other ideas? Has the research or equivalent intellectual work on which the paper
15 is based been well designed? Are the methods employed appropriate?: As a result of **poor**
16 **definitions, the hypothesis become too general.** They are not enough clear cut and needs
17 further elaboration.

18 4. Results: Are results presented clearly and analysed appropriately? Do the
19 conclusions adequately tie together the other elements of the paper?: **See above.**
20
21

22 **Answer RI/5:** Thank you for this comment. We hope that through defining our core concepts
23 and thus constructs in our hypotheses better we can overcome this issue of the hypotheses
24 being unclear.
25
26

27 [See 'Introduction'; 'Conceptual model'; 'Applied scales and analysis']
28

29 **Comment RI/6:**

30 5. Implications for research, practice and/or society: Does the paper identify clearly
31 any implications for research, practice and/or society? Does the paper bridge the gap
32 between theory and practice? How can the research be used in practice (economic and
33 commercial impact), in teaching, to influence public policy, in research (contributing to the
34 body of knowledge)? What is the impact upon society (influencing public attitudes, affecting
35 quality of life)? Are these implications consistent with the findings and conclusions of the
36 paper?:

37 In its current form, this **paper does not contain any new information.** However, as I
38 suggested above, perhaps the reason for my view is the **lack of clear definitions.** Therefore, I
39 suggest a **major revision.** The two most critical things to do is to (1) **present clear cut**
40 **definitions of all important terms you are investigating,** and (2) **get rid of some of the**
41 **more superficial references in the text and instead focus on a clear presentation and**
42 **justification of the investigated constructs.** Thereafter, I hope you can convince me that
43 there actually is a contribution in your empirical findings. I wish you good luck!
44
45
46

47 In another paper I recommend the authors to **focus more on the concept of KSRM and less**
48 **on the link between KSRM and SCM.** Perhaps that could be a more valuable contribution
49 of the empirical data.
50

51 **Answer RI/6:** Many thanks for summarising the main concerns. We consequently present
52 definitions around the key concepts and terms in the first part of our paper and reduced the
53 literature used to support our argumentation to the most important sources.
54
55

56 [See 'Introduction'; 'Conceptual Model'; whole paper]
57

58
59
60

Comment RI/7:

6. Quality of Communication: Does the paper clearly express its case, measured against the technical language of the field and the expected knowledge of the journal's readership? Has attention been paid to the clarity of expression and readability, such as sentence structure, jargon use, acronyms, etc.: I am not a native english speaker myself, but I find the language **quite nice and easy to read**.

Answer RI/7: Thank you for your positive feedback on these evaluation criterion. We believe that there is no action required here.

FOR PEER

AnswerstothecommentsofREVIEWERII**Comment RII/1:**

Comments:

The paper examines a topical and interesting issue. I have few issues to suggest in order to strengthen the paper:

1. It will be useful to **clarify whether there are any differences between the various sectors involved and the issues under examination**. I can definitely mention that supply chain and KSRM issues are very different between manufacturers, retailers etc.
2. **Why was Austria** chosen for this? How representative is for the context under investigation?
3. It will help to **discuss the managerial implications** emanating from this work.

Answer RII/1: Many thanks for summarising the suggestions to improve our paper.

Differences between sectors: We actually tested for sector specific differences but have not found any. For that reason we included a control variable in the model (please refer to the section 'Applied Scales and Analysis') so the reader sees that sector affiliation does not moderate the results and thus do not confound our model.

Why Austria? We now make the reason clearer why Austria was chosen. Besides the exceptionally good access to supply chain managers we see Austria as representing a highly developed, typical central European supply chain environment. Nevertheless, we refer to this as a limitation of our study.

Practical implications: We now better highlight the practical implications of our work in our conclusion section.

[See 'Methodology'; 'Discussion and conclusions'; 'Limitations and future research']

Comment RII/2:

Additional Questions:

1. Originality: Does the paper contain new and significant information adequate to justify publication?: This is an original piece of work.

2. Relationship to Literature: Does the paper demonstrate an adequate understanding of the relevant literature in the field and cite an appropriate range of literature sources? Is any significant work ignored?: Strong!

3. Methodology: Is the paper's argument built on an appropriate base of theory, concepts, or other ideas? Has the research or equivalent intellectual work on which the paper is based been well designed? Are the methods employed appropriate?: Very detailed.

4. Results: Are results presented clearly and analysed appropriately? Do the conclusions adequately tie together the other elements of the paper?: Good presentation of results.

Answer RII/2: Thank you for your positive feedback on these evaluation criteria. We believe that there is no action required here.

Comment RII/3:

5. Implications for research, practice and/or society: Does the paper identify clearly any implications for research, practice and/or society? Does the paper bridge the gap

between theory and practice? How can the research be used in practice (economic and commercial impact), in teaching, to influence public policy, in research (contributing to the

1
2
3 body of knowledge)? What is the impact upon society (influencing public attitudes, affecting
4 quality of life)? Are these implications consistent with the findings and conclusions of the
5 paper?: **Good although they can be improved.**
6
7

8 **Answer RII/3:** Based on the reviewer's comment we now better highlight the practical
9 implications in our conclusion section.
10

11 [See 'Discussion and conclusions']
12

13
14 **Comment RII/4:**

15 b>6. Quality of Communication: Does the paper clearly express its case, measured
16 against the technical language of the field and the expected knowledge of the journal's
17 readership? Has attention been paid to the clarity of expression and readability, such as
18 sentence structure, jargon use, acronyms, etc.: Yes
19
20

21
22 **Answer RII/4:** Thank you for your positive feedback on these evaluation criterion. We
23 believe that there is no action required here.
