Table S2. Analysis of covariance for growth analysis data. Values represent the coefficient of determination (r^2), significance levels for the Levene test for the homogeneity of variance, and P values for (a) the relationship between the covariate (x); time or total plant DM and the dependent variable (y), (b) the effect of the fixed factor and (c) the interaction between the covariate and the fixed factor where the fixed factor is:

(A) growth temperature: comparison of 23°C-grown (n=5) and 5°C-shifted plants with pre-existing (PE) leaves only (n=5) or of 23°C-grown (n=5) and 5°C-shifted plants (n=7) with newly-developed (ND) leaves,

or

(B) leaf type: comparison of 5°C-shifted plants before (PE; n=5) and after (ND; n=7) the emergence of new leaves.

Fixed factor (A) Growth temperature
