Access Denied? Twenty-first Century Technology in Schools

The term 'twenty-first century technology' refers primarily to multi-functional equipment or devices with Internet connectivity capable of using Web 2.0 tools or applications. At the time of writing most desktop computers, personal digital and handheld devices are now not only capable for accessing the Internet, but also have the capability to allow for user generated content and social networking. In its original form (Web 1.0) the Internet was used by a small elite in a 'delivery and receipt structure' as it only permitted a one-way flow of information and service to the end user. Web 2.0 is personified, however, as a 'read and write', democratic and highly participatory publishing model. It is not just access to greater volumes of content which is radically changing the Internet, however, but rather the fact that users can access a greater volume of people and potential communities (Crook, 2008). Web 2.0 has moved away from the mainly text-based architecture of the first generation Web and has begun the process of fostering social interaction and knowledge representation based on multi-modal representations including images (e.g. Flickr), video (e.g. YouTube), audio (e.g. Podcasts) and combinations of these various media. This in turn has transformed the kind of social interaction possible over the Internet making it feasible to undertake discourse and dialogue without having to rely solely on text based mediation. Twenty-first century technologies have thus superseded Web 1.0 which, like most printed material, had remained epistemologically traditional and maintained by a relatively small group of privileged authors (Dede, 2008; Nagy and Bigum, 2007). Web 2.0 technologies, however, represent a fundamental change for education, shifting from passive acquisition of someone else's ideas to active learning experiences that empower people to inquire, critique, create, collaborate, problem solve and create understanding (Dede & Barb, 2009).

Twenty-first century technologies are also about the portability of mobile digital devices which now have the potential to allow any-time access for users either through Wi-Fi or mobile broadband providers and for those devices to become personal. (Traxler, 2010) lists mobile devices as including smart-phones, game consoles, digital cameras, media players, netbooks, in-car *sat-nav* and handheld computers. Almost everyone owns one, uses one and, as he points out, often has more than one. Such devices he suggests are both pervasive and ubiquitous, conspicuous and unobtrusive, noteworthy and taken-for-granted. Their roles are new and completely different from older, static, and less personal information technologies such as desktop computers, he argues, going on to say (author emphasis):

Interacting with a desktop computer takes place in a bubble, and in dedicated times and places where the user has his or her back to the

rest of the world for a substantial and probably premeditated episode. Interacting with mobile technologies is different and is woven into all the times and places of students' lives. Desktop technologies and landline phones are about *buildings*; mobile devices are about *people*. (Traxler, 2010: 5)

The implications for education caused by the development of twenty-first century technologies are enormous and the anticipated change probably ranks alongside the introduction of the printing press in terms of historical importance. This article considers those implications and draws on research we have recently conducted in schools and other educational settings in England and Scotland. We conclude that the need to allow use of personal digital devices in schools (and other sectors of public education) seems inexorable the further we go into the new millennium. This simple premise is fraught with many difficulties and challenges, however, which suggest that for many students the current situation is 'Access Denied', a situation we find difficult to understand given the potential benefits of such devices.

The Research Base

In order to explore these issues we draw upon a body of empirical research we have accumulated from different projects we have been engaged in during 2012-13. Firstly we were members of a research team commissioned to undertake the evaluation of the pilot project in Scottish schools where students were allowed personal use of iPads including, in many instances, the right to take them home. In total 11 teachers and the majority of Headteachers or senior staff within the pilot schools were interviewed during the course of the pilot. Additionally a number of advisory staff and senior personnel from each local authority were also interviewed separately as part of the leadership strand (Authors #1, 2012). We have since been engaged in a similar evaluation in a major city in Scotland where three schools are undertaking a pilot project involving the use of personal digital devices (again with the right to take them home). In this instance these were either android or windows devices (Authors #2, forthcoming). Both projects also employed interviews with headteachers and project leaders within the schools as well as on-line baseline and exit surveys of students, teachers and parents from which quantitative data were accumulated. [Quantitative data derived from the two evaluations are supplemented by a third survey conducted with a large comprehensive school in London. In total 1017 students, ranging from final two years of primary school age through to sixth form students, completed an on-line survey prior to the introduction of personal digital devices. Interim and exit surveys were also carried out in both Scottish projects, but we are not drawing on the data from those surveys in this paper.](#)

1
2
3 The findings from these two pilot projects [and the survey of the London school](#)
4 are supplemented by data emerging from a separate enquiry into pedagogical
5 leadership in the twenty-first century (Authors #3, 2012, 2013) for which
6 headteachers and leaders of early years settings were interviewed, along with
7 teachers and students within those organisations. Finally, a focus group
8 comprising headteacher, project leader and parents of a Scottish primary
9 school were interviewed in relation to their views relating to the introduction of
10 personal devices into the school which proved controversial and resulted in
11 wide media coverage.
12
13
14

15 **The Challenges to Schools**

16 Schools, like most other education institutions, are organised around spatial
17 and temporal considerations such as buildings, timetables, calendars and
18 internal structures which are designed to classify and manage students. This,
19 is “getting out of step with how students perceive the world they live in and
20 [...] changes are needed to [remain] aligned to a changed and mobile society”
21 (Traxler, 2010: 7). It now appears there is “... a sharp disconnect between
22 the way students are taught in school and the way the outside world
23 approaches socialization, meaning-making, and accomplishment “ (Klopfer,
24 Osterweil, Groff, & Haas, 2010: 5).
25
26
27
28
29

30 Schools are currently still training autonomous problem solvers,
31 whereas as students enter the workplace, they are increasingly being
32 asked to work in teams, drawing on different sets of expertise, and
33 collaborating to solve problems. (Jenkins, Purushotma, Clinton, Weigel,
34 & Robison, 2006: 19)
35

36 [We do not see the end of formal schooling as a result of digital technologies,](#)
37 [but do anticipate a much greater emphasis on continual learning and, in line](#)
38 [with contemporary thinking by contributors such as Stephen Heppell,](#)
39 [recognising the value of learning outside the classroom \(Lee, n.d.\).](#) Two
40 issues thus emerge from this scenario: firstly the capability of personal digital
41 devices induces a challenge to pedagogy; secondly, student demand to use
42 such devices in school (and parental acceptance of such devices) is
43 increasing, yet school management is reluctant to allow such use. (Heinrich,
44 2012: 7-8).
45
46
47
48

49 In the first instance, as we point out in the evaluation of a pilot project in eight
50 Scottish schools, the use of personal iPads:
51
52

53 ... challenges many of the assumptions and paradigms around which
54 traditional models of teaching and learning are constructed, including
55 the authority and expertise of the teacher, the role of the learner as an
56 author and producer of knowledge, rather than simply a consumer, and
57 the power relationships which exist between teacher and learner when
58
59
60

1
2
3 the teacher is no longer the sole arbiter or conduit to knowledge and
4 truth. (Authors #1, 2012: 56).

5
6
7 As we mention later in the same report the availability of a personal internet
8 enabled device, controlled mainly by the student and not the teacher, is
9 changing the traditional dynamics and pedagogical patterns of the classroom,
10 in ways which are considered to be transformational (Authors #1, 2012).
11 These are findings which demonstrate how such technologies:

12
13
14 ... challenge the role of the education professions and educational
15 institutions, progressively demystifying their roles as gatekeepers,
16 custodians, and arbiters of technology and knowledge. This is not to
17 ignore their role as guides or intermediaries, nor is it to ignore their
18 work in nurturing intrinsic motivation and providing extrinsic motivation,
19 but serves merely to place them all in a more complex context.
20 (Traxler, 2010: 10)
21
22

23 Learning that makes appropriate use of personalised digital technologies thus
24 has the potential to induce change to schools in the twenty-first century.
25 Knowledge is no longer separate to the learner, but instead can be
26 challenged, shaped and even changed through what is referred to as a
27 “participatory culture” which “reworks the rules by which school, cultural
28 expression, civic life, and work operate” (Jenkins et al, 2006: 9). To be
29 successful in such an age the teacher “has to move from deliverer of content
30 to the curator of a learning journey. If we do not move to this role we are
31 making ourselves redundant as teachers” (Headteacher, Scottish primary
32 school).
33
34
35

36
37 Teachers, we can deduce from these contributions to the debate, do still have
38 a responsibility to “do the teaching part”, but need to change their practice in
39 order to “find less didactic ways of teaching that didn’t involve spoon-feeding
40 students” and to become “a facilitator encouraging students to participate in
41 independent and collaborative learning” (Hague, 2010: 16-17). Schools in the
42 twenty-first century have the opportunity to embrace digital technologies
43 through use of personal (or personalised) devices:
44
45
46

47
48 Personalisation and choice [...] emphasise how access to an internet
49 capable device equipped with powerful construction tools, enable
50 learners and teachers to have a far greater degree of agency and
51 choice in how, when and where they undertake learning. (Authors #1,
52 2012: 105)
53

54 Such an approach moves responsibility for learning (and engagement)
55 beyond the confines of school and classroom and into the student’s personal
56 life to a far greater extent than most educationalists had imagined. As Traxler
57
58
59
60

1
2
3 points out (author emphasis), the boundary between “*formal* learning activities
4 *in our institutions on our equipment*, and *self-motivated* learning activities
5 *outside our institutions not on our equipment*” becomes blurred if we embrace
6 student devices” (Traxler, 2010: 11). Formerly he argues, educators had a
7 duty to regulate the former and had no mandate to regulate the latter.
8
9

10
11 This may be one reason why school managers seem reluctant to embrace
12 such technologies, a factor that will be explored in greater depth later in the
13 article when we explore the concerns of parents, teachers and administrators
14 in regard to allowing student access to a world beyond their control. Other
15 reasons for this seeming reluctance will also be explored, particularly the
16 shifting emphasis on teacher behaviour in a digital age. As Hague (2010: 18)
17 suggests, for example: “a change in pedagogical process and an emphasis on
18 independent learning could often be perceived as risky for teachers whose
19 performance reviews depended on moving students up by a certain amount of
20 National Curriculum levels”, a view further supported by Rheingold who
21 suggests “the political and economic necessity of teaching to the test leaves
22 little room to fit these kinds of skills lessons into mandated and standardized
23 curriculum” (Rheingold, 2008: 99). This led us to conclude in relation to our
24 work in Scotland that:
25
26
27
28
29

30 ... the extent to which teachers and the structures within which they
31 operate are able and are predisposed to accommodate these changes
32 which shift responsibility and agency for learning from the teacher to
33 the student and their personal learning networks. [...] raises challenges
34 for teachers, including the need to find the appropriate balance
35 between complete freedom and choice for learners and the need to
36 provide a framework to guide learners (Authors #1, 2012: 29).
37
38

39 **Barriers to change**

40 It has been suggested there are a number of central factors, each with its own
41 critical variables, which interact with one another to produce barriers to
42 implementing technological innovations in educational settings (Groff &
43 Mouza, 2008). They identify six factors in total: research and policy,
44 district/schools, teachers, students, the project and the technology itself.
45 Whilst these factors are inevitably evident in all technology related projects,
46 for the purpose of this article we assume factors associated with the students
47 and the technology are not worthy of greater consideration in relation to our
48 data. This is because we do not see any evidence of reticence amongst the
49 student body to engage with the type of personal digital technologies that are
50 synonymous with the twenty-first century (see Table 1 below); neither do we
51 consider there to be any questions in relation to such technologies. [We do
52 note a small difference in use of mobile technologies at home with secondary
53 school students making greater use of instant messaging, chat forums, social
54 networks and downloading of music \(see Table 1 below\). In this instance we](#)

Access Denied? Twenty-First Century Technology in Schools.

1
2
3 have compared the final year primary school students (P6) from both Scottish
4 projects with first year secondary schools in Scotland and Year 10 pupils in
5 England (age 14-15 years).
6

7
8 - Insert Table 1 about here -
9

10
11 Similarly secondary students made greater use of mobile and laptop devices
12 at home for school based work than their primary counterparts (see Table 2
13 below)
14

15
16 - Insert Table 2 about here -
17

18
19 As can be seen from the discussion and data presented above, we see these
20 technologies as central and necessary to the learning environment now
21 occupied by students in schools and perceive very little difference in the
22 attitude or perceived ability of primary and secondary students (see Table 3
23 below).
24
25

26
27 - Insert Table 3 about here -
28

29
30 Consequently we report our findings, emerging implications and conclusions
31 in relation to the following categories of factors:
32

- 33 (a) policy;
34 (b) issues associated with schools and teacher;
35 (c) issues relating to parents and the family home.
36
37

38
39 As indicated by Groff & Mouza, however, these factors are seldom discreet
40 and do interact with each other, so there may be times in the subsequent
41 discussion where issues cross over these somewhat artificial boundary
42 classifications.
43
44

45 **Factors Associated with Policy**

46 There is fear evident amongst politicians, local authority officials and the
47 public face of schools that places a major barrier to the use of twenty-first
48 century technologies to support the education of young people. The main
49 concerns are with control (sometimes of knowledge) and with the safety of
50 children in online environments. As Prensky suggests in a prescient manner:
51
52

53
54 New technology still faces a great deal of resistance. Today, even in
55 many schools with computers, Luddite administrators (and even
56 Luddite technology administrators) lock down the machines, refusing to
57 allow students to access email. Many also block instant messaging, cell
58
59
60

1
2
3 phones, cell phone cameras, unfiltered Internet access, *Wikipedia*, and
4 other potentially highly effective educational tools and technologies, to
5 our kids' tremendous frustration. (Prensky, 2005)
6

7
8 **Prensky's overview remains relevant with** our research demonstrating network
9 service providers and some school based controllers to be zealous, perhaps
10 overly so, in the use of firewalls designed to prevent access to internet sites
11 and resources. Similarly the use of personally owned handheld devices,
12 particularly those with instant messaging and social networking capability, was
13 officially denied in all schools in our project. No school, for example,
14 sanctioned the use of mobile phones in the learning environment although,
15 interestingly, many turned a blind eye (particularly in secondary schools) to
16 the use of such devices in break times and occasionally in lessons where it
17 was considered easier and quicker to search online than to use other
18 communication devices. Officially, however, the need for security on all
19 devices was paramount and of a higher priority than open access. The
20 experience of young people in school, however, often contrasts sharply with
21 their everyday practice within their home environment or their peer group
22 interactions.
23
24
25
26

27
28 Many students feel that when they come into school they have to
29 "power down" to fit into an environment that offers fewer options for
30 learning than are available in the life they live outside of the school.
31 (Ontario Public School Boards' Association, 2009: 7)
32

33
34 The restrictive online environment was the norm in most schools and caused
35 concern among students and teaching staff with a sense of lost opportunity.
36 In a different evaluation of the use of iPads in schools, for example, students
37 found the filtering restrictions on school networks frustrating and the main
38 source of student complaints (Heinrich, 2012). As the headteacher of a
39 Scottish secondary school that was piloting 1-1 devices pointed out, corporate
40 systems that "lock everything down, means teachers can't do the kind of
41 things that they want to do with kids", a view graphically illustrated by the
42 school's project manager:
43
44
45

46
47 Where it falls down is the categories which are justified as being
48 inappropriate. 90 per cent of fantastic resources I often find at home, I
49 go "fantastic", just click that and give that to my senior kids tomorrow.
50 Then I come in to set the thing up on a computer and of course it
51 comes up says "Block - this is classified as games content, or this is
52 social media content" and so on. So you run into a lot of problems like
53 that (1-1 Project Manager, Scottish Secondary School)
54

55
56 Traditionally, education has been impeded by the security and other potential
57 dangers of employing social networking technologies (Klopfer, Osterweil,
58
59
60

1
2
3 Groff, & Haas, 2010). Our research demonstrated there were two elements to
4 this desire to maintain security; the first is technical, the second is concerns
5 about eSafety.
6
7

8 Most schools in our research were using corporate networking systems. In
9 other words their hardware provision and connectivity were managed by a
10 controlling agency such as a local authority which, invariably used Windows
11 based systems running on corporate servers. This often caused problems for
12 those schools using devices like the iPod Touch and the iPad which were not
13 designed to support a corporate or networked technology solution which “still
14 underpins the technology paradigm evident in most local authorities and
15 schools” (Authors #1, 2012: 29). This challenge is summed up by one
16 education adviser in a Scottish local authority who reported:
17
18
19

20
21 Part of the challenge working in such an environment is that Corporate
22 want you to tell them what you’re going to have so that they can enable
23 that and nothing else and the pace that they can deal with change is
24 totally incompatible with the users’ experience.
25
26

27 The major concerns, however, were with an almost evangelical desire to
28 ensure that no child could be exposed to inappropriate material or
29 engagement with the Internet. Whilst all schools we worked with had access
30 to broadband this was a highly regulated environment, unlike at home, where
31 most children had access to commercial service providers. Consequently
32 teachers and schools had to fight hard to get access to some highly desirable
33 resources with many stories emerging during our research of headteachers
34 and project managers spending unsustainable amounts of time overcoming
35 the resistance of corporate IT, a common situation represented by the story of
36 a headteacher of a primary school in England:
37
38
39

40 We had to fight to have Twitter released, we had to fight to have
41 Youtube released to go on our site, yet they are fantastic resources.
42 We have had awful difficulties in getting them released.
43
44

45 Corporate services and schools within our research had sought a number of
46 ways of ‘ensuring’ safety. In Scotland, for example, there was general use of
47 an on-line intranet (GLOW) together with commercial safeguarding software
48 both of which were designed to provide a safe learning environment.
49 Individual schools made use of safe participatory collaboration sites
50 specifically designed for schools, such as Edmodo and LearnPad. As
51 indicated above, there was an almost blanket ban on the use of mobile
52 phones especially ones with internet access. Similarly there was no evidence
53 of a ‘bring your own device’ policy with all schools adopting an acceptable use
54 policy (AUP) in regard to portable equipment and devices they provided.
55 Those schools using Apple devices gave praise for its strict management of
56
57
58
59
60

1
2
3 applications through its online store which gave them a sense of security not
4 always provided by windows based or android applications. Despite all of
5 these measures, however, there was clear recognition for a change of policy,
6 for a more liberal attitude towards new technologies and to move away from
7 the centralised management of institutional provision which had led to a “a
8 narrow prescription of the hardware, peripherals, connectivity, operating
9 systems, applications, and privileges that could be accessed by students and
10 lecturers” (Traxler, 2010, p. 10). The emerging view, discussed more fully
11 below, is that students “should learn to manage risks, whenever and wherever
12 they go online, and understand safe and responsible behaviour in using
13 technology at their learning provider, in the workplace, in the home and
14 beyond” (BECTA, 2010: 3), an approach perhaps best summed up by the
15 headteacher mentioned above who had to fight for access to Twitter and
16 YouTube:
17
18
19
20
21

22 Now I know well and truly there are things on Youtube that you
23 wouldn't perhaps wish children to see, but the point is children have
24 computers and access at home and at their friends homes and
25 therefore you have to go there. You can't uninvent it, so you have to
26 therefore educate the children and the families to prepare the children
27 for what they may come across and how then to proceed and deal with
28 it. Ignoring it and pretending that you protect them in this cocoon is
29 ridiculous because once they have walked out your front door, and
30 maybe before they have walked out your front door, they are accessing
31 all sorts of stuff.
32
33

34 **Factors Associated with Schools and Teachers**

35 Schools facing the challenge of adapting to and adopting twenty-first
36 technology have to address a number of issues that relate to both the policy
37 issues outlined above and to the difficulty of managing change within their
38 own institution. Change is complete when an innovation is no longer deemed
39 novel, but has become a way of life. The issues emerging from a review of
40 the relevant literature indicate the conservative nature of the teacher
41 workforce can present difficulty in allowing students to access learning
42 opportunities that are available through new technologies.
43
44
45

46
47 Although schools are famously conservative with “teachers who are wonderful
48 passive resisters” (Headteacher, Scottish primary school) conversely our
49 initial research in Scotland demonstrated high levels of enthusiasm and
50 engagement with the personalised use of iPads (Authors #1, 2012). Later
51 research undertaken in three Scottish schools which were piloting the use of
52 android devices and netbooks showed a similar level of engagement with
53 teachers and pupils (Authors #2, forthcoming). In part we consider this may
54 be a feature of the nature of change processes where innovators and early
55 adopters (who between them typically account for about 16 per cent of the
56
57
58
59
60

1
2
3 population) tend to enthusiastically embrace a new initiative with a further 34
4 per cent (the early majority) following quite quickly once persuaded the
5 advantages outweigh the disadvantages (Rogers, 1962). In the case of our
6 first evaluation in Scotland there was a probability that we were working
7 almost exclusively with innovators and early adopters, whilst in the second
8 evaluation in city schools we saw evidence of greater engagement across the
9 secondary schools with one project leader commenting that:
10
11

12
13 In any other technology launch that we've run it always falls to
14 somebody like me to drive it and the problem with that is if I'm driving it
15 then everybody else is kind of following my lead, and this time around
16 it's been the complete opposite of that and it's been really, really
17 interesting to see that happening.
18
19

20 Conventional wisdom would generally support the view, however, that schools
21 are generally more resistant to fundamental change than our pioneers.
22 Typical in that regard was the account provided to us by an education adviser
23 in Scotland of a typical middle class secondary school with an established
24 reputation for good examination results:
25
26

27
28 [...] a lot of staff who go there never leave it because it's quite an easy
29 school I think. But they're very resistant to the idea of one to one
30 personal digital devices ... "Oh, that'll never work here, that'll never
31 work here. Our wains'll be, you know ...". They can't see beyond the
32 logistic issues about damage and theft and all the rest of it, even, you
33 know, bringing in porn on it, that kind of thing, they can't see how that
34 would not happen.
35
36

37 Henrich concludes that rather than opening up to the affordances of twenty
38 first technologies schools it seems, like the local authorities we encountered,
39 prefer to retain control of learning:
40
41

42 There is broad agreement on the potential of such tools, notably
43 around the idea of anytime, anywhere learning and the facility for
44 learners to access courses and resources at will and to both ask
45 questions of and to publish to an audience far beyond school. This has
46 not, however, translated into radical pedagogical approaches in
47 schools which wish to remain in full control of a pupil's learning through
48 restrictions on web access, virtual learning environments (VLEs) that
49 are largely document repositories with little or no student participation
50 and where learning is directed along narrow and sometimes shallow
51 paths. (Heinrich, 2012: 9).
52
53
54

55 **Factors Associated with Parents and the Family Home**

56 The major stumbling block with the provision of personal digital devices is
57 finance, described by one education adviser in Scotland as the "elephant in
58
59
60

1
2
3 the room". The provision of useful, stable and reliable personal devices is still
4 seen as an expense that is beyond most schools and one that needs parental
5 contribution. Devices were provided in the schools involved in the two
6 Scottish projects mainly through a combination of local authority and schools'
7 devolved funding. The only attempt to allow purchase by the parents through
8 a leasing scheme fell foul of adverse media coverage based on the notion that
9 education should remain free to students. One parent, for example, asked:
10
11

12
13 If it is a tool for use in the classroom in the same way that a smart
14 board is or a pen and pencil is, and it's something that's required in the
15 classroom, why does that have to be something that's paid for by
16 parents and taken home?
17

18
19 This situation is compounded by the reluctance of schools (and education
20 systems) to allow the use of personal devices, the 'bring your own device'
21 approach to resourcing. At this stage, therefore, schools are not able to
22 adequately resource all students with a personal device leaving the potential
23 for universal adoption of the affordances of twenty-first technologies seriously
24 compromised on financial grounds alone.
25
26

27
28 Some parents were also concerned with the concept of eSafety and saw this
29 as a barrier to adoption of personal devices that transcended the gap between
30 home and school. Fears of on-line grooming, inappropriate use of the
31 internet and over use of the device were expressed in some cases. Other
32 issues expressed of safety related to personal security for students who may
33 be a target of robbery on their way to and from school (and, in some cases,
34 from within the school by other students who did not have such a device).
35
36

37
38 There were also concerns in regard to equity if there was a "possible disparity
39 that worries parents and the concept almost of a division being created by the
40 quality of the device that's provided or used" (Education Adviser – Scottish
41 local authority). These concerns about equity were extended further with
42 some parents feeling whilst the use by some students of personal devices
43 would initially place them at advantage they may later find that further
44 progress was delayed whilst they waited for "other children to catch up"
45 (Parent – Scottish primary school).
46
47
48

49 **Discussion**

50 Despite these many barriers the general consensus amongst the adult
51 participants in our research was that students need to be encouraged to use
52 twenty-first century technologies as integral to their school (and home) life, a
53 view perhaps best summed up by the headteacher of a Scottish primary
54 school who considered "we are selling ourselves short if we do not see this as
55 a way of life". The concerns of policy, pedagogy, finance, eSafety and equity
56
57
58
59
60

1
2
3 have all, in their own way, led to the scenario of 'access denied', however,
4 and to the probable detriment of most students. Whilst we have yet to
5 overcome this range of issues we do have many clues and worked examples
6 of how this may be done.
7

8
9
10 *Policy:* As we reported on the iPad evaluation in Scotland, there were two
11 main areas where local authorities were generally considered not to be
12 matching the expectation of the school based users: firstly corporate IT
13 systems were not seen to be as responsive to local need as was required of a
14 project such as this, and; secondly there were difficulties with filtering systems
15 for the use of school computers to access the Internet. (Authors #1, 2012).
16 Here we can see the dilemma – we have the potential to unlock fantastic
17 resources yet as an education system we have grave concerns over safety.
18 To us the most powerful part of our work is the notion that we cannot
19 “uninvent” technology and a clear message from all participants in our various
20 research projects was that we have to learn to manage it. Internet access is
21 “equivalent of King Canute, you cannot stop it” (1-1 Project Manager, Scottish
22 secondary school), views echoed by a deputy head of an English secondary
23 school and a local authority education adviser in Scotland, both of whom
24 recognise the futility of denying access to the young people of the twenty first
25 century many of who will make use of a proxy server to get to those parts of
26 the internet their school server cannot reach. The general consensus was
27 that this was a behavioural issue where students had to be taught
28 responsibility and undertake self-control. The analogy of road safety is
29 applicable here:
30
31
32
33
34
35

36
37 If we put restrictions on the device we are not building responsibility in
38 the child. We think of it like road safety (and we would not say to
39 children don't go there). The Internet is like a fantastic road system so
40 we encourage them to use it (Headteacher, Scottish primary school)
41

42 If anything there is frustration as illustrated by a secondary headteacher in
43 England :

44
45 We don't want our kids to be passive learners, they can't be passive
46 people, they can't be passive citizens. We had this big debate [in
47 school] about where the future and the world is going and if we don't
48 actually enable our youngsters to be able to question their world from a
49 point of knowledge, then actually they haven't got a future have they ...
50 they will be forever manipulated and I think the potential to be
51 manipulated in the future will be so much greater through technology,
52 so there is again a moral imperative.
53
54
55

56 The key issue in policy terms seems to be trust, to work on a responsible use
57 approach. All schools we studied had an Acceptable Use Policy, with many of
58
59
60

1
2
3 them retaining rights to view browsing history and to log activity, whilst
4 similarly recognising they did not have mechanisms in place to deal with the
5 activities that go on outside the confines of the corporate network or the
6 school 's filtering systems. Ultimately this was considered to be an issue of
7 behaviour rather than a technology with misuse frequently considered as
8 being the same as bringing in any kind of inappropriate content in paper and
9 magazine form. The emerging scene is one perhaps best summed up by the
10 project leader of a primary school in Scotland that was introducing digital
11 tablets for school and home use:
12
13

14
15
16 I think ultimately it comes down to trust. And there will be people who
17 will probably abuse that trust to a point, but I think the majority of
18 people, parents and children, will honour that. That's certainly what
19 I've found in the past with, you know, having led IT in a number of
20 different schools, that the vast majority of children respect it very, very
21 clearly.
22

23
24 *Pedagogy:* What we have witnessed pedagogically is that most teachers
25 adapt to the inclusion of personal digital devices in the school with enthusiasm
26 and flair, often demonstrating innovative approaches to learning even when
27 not considered to be pioneers. Our evaluations of the Scottish projects show
28 the process of change being radically altered in such circumstances with
29 project leaders ('experts' in their own right) often struggling to keep pace with
30 so-called 'novices' (Authors #1, 2012; Authors #2, forthcoming). The natural
31 tendency of teachers to be conservative seems to dissipate, therefore, with
32 the introduction of a portable digital device such as an iPad, digital tablet or
33 netbook. We have witnessed substantial shifts in classroom organisation,
34 student learning and stronger links between home and school as a result of
35 introducing personal digital devices. In the evaluation of the iPad pilot in
36 Scotland we found:
37
38
39
40

41
42 This study has started to pinpoint how personal ownership of a mobile
43 device can help to make school more realistic, bridging the gap
44 between formal and informal sites of learning. [...] Parents found that
45 the device helped to bridge the home school divide and found the
46 device had a positive impact on the child's attitude to learning and the
47 quality of that learning. (Authors #1, 2012: 105 & 110).
48

49
50 *Finance:* The provision of personal devices for all students may be achieved
51 in two ways, either the school leads on the process of purchasing (but retains
52 a measure of control) or a 'bring your own device' (BYOD) policy is
53 implemented. What we know is that most school age children use mobile
54 technology in their life outside school on a daily basis with all parents in the
55 city pilot in Scotland allowing use of a mobile device with internet access in
56 the home (see Table 1, above). The major problem with a BYOD approach is
57
58
59
60

1
2
3 consistency of operating platforms and connectivity; what schools require is
4 consistency of both. Assuming that is argument enough to not recommend a
5 BYOD approach at this stage (although this may become inevitable in the
6 future), then the issue of purchase (and maintenance) of personal devices has
7 to be addressed at the school level. Our findings tend to demonstrate that
8 parents typically make a substantial financial contribution to the children's
9 education through the purchase of school uniform, sports kit, additional
10 equipment and consumables, so perhaps it is time to also consider the
11 personal device as an essential requirement for school. Various leasing
12 schemes in England have demonstrated that the cost per month per pupil can
13 be as low as an entry level internet phone, with such schemes also managing
14 to cater for those parents who find it difficult to make their contribution in much
15 the same way as the social benefits system works. All such schemes we
16 have seen in operation have also included insurance for breakage and loss in
17 addition to warranty.
18
19
20
21
22

23 *eSafety:* We found the vast majority of parents and all school based staff to be
24 aware and, in accordance with national guidelines in that they "must be
25 engaged with e-safety in order for responsible behaviours to develop"
26 (BECTA, 2010: 9). As an Education Adviser in Scotland pointed out,
27 however, there has to be an acceptance that in encouraging use at home
28 there was an inevitability that children would be exposed to inappropriate
29 material but we "just have to deal with it, not make a big thing about it
30 necessarily, but make it clear that this device is for education and yes, sure
31 you can play games on it, but your big brother isn't allowed to do what a big
32 brother wants to do with it". What we found in our research was that whilst 95
33 per cent of parents applied rules generally parents adopted a flexible and
34 liberal position as regards the use of technology at home (Authors #1, 2012).
35 The response of most parents to home use and eSafety was perhaps best
36 summed up by a parent in a Scottish primary school who ran the lunchtime IT
37 club and managed her own children in their use of the device under the
38 principle:
39
40
41
42
43
44

45 It's nothing to do with how many protections you put on it, my children
46 know what is bad and what is good and it's all about in the mind and
47 my child would be repulsed by any of the things you mentioned. It's
48 about the ethics of your child, it's not about the safety monitors that you
49 put on your website or any of your internet sites.
50
51

52 *Equity:* Although this is an issue of concern to the universal provision of
53 personal digital devices there were few instances of such concerns in our
54 research. The provision of twenty-first century technologies, particularly hand
55 held devices (smartphones), appears almost ubiquitous with both students
56 and teachers making extensive use of them on a daily basis (see Table 1,
57
58
59
60

1
2
3 above, for example). In addition as the head teacher of a secondary school in
4 a socio–economically challenged part of a major Scottish city was of the view
5 that “poorer homes tend to have more in the way of technology than people
6 expect – and often that technology will give them access to the Internet”. As a
7 consequence he was more concerned with access to quality learning
8 resources, with that process to be directed:
9
10

11
12 If we can be directing them both in school and out of school at the right
13 kind of resources, and getting them to create things, then we can only
14 be making a powerful impact on learning and teaching.
15

16
17 In summary, therefore, the spectre of inequitable access or use did not appear
18 in any of our research and we consider this may be more of a myth than a
19 reality. We are of the view, therefore, that whilst examples of inequity may be
20 seen in the wider context there is little reason for this to be the case in the
21 twenty-first century when virtually all students have the device necessary to
22 achieve access and it is generally only policy and intransigence that deny
23 them.
24
25

26 27 **Conclusions**

28 Two responses from headteachers who participated in our research resonate
29 loudly with us when drawing conclusions: firstly that we cannot “uninvent”
30 these technologies and, secondly, we should treat them the same way for
31 young people as we do with use of the road system. In denying access to
32 such technologies (particularly portable handheld personal devices) the
33 various parts of the school system are effectively enacting a twenty-first
34 century of King Canute and his impossible ambition of turning back the sea.
35 What we have witnessed in the schools where such devices have been used
36 liberally (and effectively) is that the potential gains are enormous in terms of
37 enhancing the learning environment. The four barriers to widespread
38 adoption of twenty-first century were related to policy, pedagogy, finance, and
39 eSafety. We consider that none of these issues is insurmountable and, given
40 the evidence we have gathered in our various recent projects, can be
41 overcome with a mixture of determination and confidence from those in
42 decision making roles within the school system. Finally we note that
43 concerns over eSafety have been successfully dealt with in schools through
44 approaches based on behaviour management and the development of trust of
45 students, rather than restricting or denying access. This, to our mind, is an
46 appropriate response to the challenges presented by twenty-first century
47 technologies rather than the unfortunate (and largely unnecessary) situation of
48 ‘access denied’.
